- With intravenous use Use intravenous infusion with caution if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² (monitor renal function); avoid intravenous infusion if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).

- Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion, dilute 250 mg with 50 mL Sodium Chloride 0.9% and give requisite dose through an in-line filter (0.2 micron) over 60 minutes.

- With oral use For oral liquid, do not take with food; swish around mouth and swallow, do not rinse afterwards.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

**PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.

- With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for infusion**

**EXCIPIENTS:** May contain Propylene glycol

- **Sporanox** (Janssen-Cilag Ltd) Itraconazole 10 mg per 1 ml Sporanox I.V. 250 mg/25 ml solution for infusion ampoules and diluent | 1 ampoule £79.71

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS** 9, 23

- **Itraconazole** (Non-proprietary)

  - Itraconazole 10 mg per 1 ml Itraconazole 50 mg/ml oral solution sugar free-sugar-free | 150 ml (£) £38.34 DT price + £58.34

  - **Sporanox** (Janssen-Cilag Ltd) Itraconazole 10 mg per 1 ml Itraconazole 50 mg/ml oral solution sugar-free | 150 ml (£) £38.34 DT price + £58.34

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 9, 21, 25

- **Itraconazole** (Non-proprietary)

  - Itraconazole 100 mg Itraconazole 100 mg capsules | 15 capsule (£) £13.77 DT price + £3.19 | 60 capsule (£) £56.21

  - **Sporanox** (Janssen-Cilag Ltd) Itraconazole 100 mg Sporanox-Pulse 100 mg capsules | 28 capsule (£) £25.72

  - **Sporanox** 1000 mg capsules | 4 capsule (£) £3.67 | 15 capsule (£) £13.77 DT price + £3.19 | 60 capsule (£) £55.10

**Voriconazole**

**INDICATIONS AND DOSE**

Invasive aspergillosis | Serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive *flucanoazole*-resistant *Candida* spp. (including *C. krusei*)

- **BY MOUTH**

  - Child 2-11 years: Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required.

  - Child 12-14 years (body-weight up to 50 kg): Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required.

  - Child 12-14 years (body-weight 50 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours.

  - Child 15-17 years (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours.

  - Child 15-17 years (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours.

**BNFC 2017–2018**

**Infection**

5
lesions and squamous cell carcinoma, and discontinue treatment if they occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Toxicity in animal studies—manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**
  Child 12-17 years In mild to moderate hepatic cirrhosis use usual initial dose then halve subsequent doses. No information available for severe hepatic cirrhosis—manufacturer advises use only if potential benefit outweighs risk.

- **RENAL IMPAIRMENT**
  Child 2-12 years No information available.
  Child 12-17 years Intravenous vehicle may accumulate if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

- **MONITORING REQUIREMENTS**
  - Monitor renal function.
  - Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

- **PATIENT AND CARER ADVICE**
  Patients and their carers should be advised to keep the alert card with them at all times.

  Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

  Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

### Tablet

**CAUTIONARY AND ADVISORY LABELS** 9, 11, 23

- **Voriconazole**
  - **Non-proprietary**
  - **Voriconazole** 50 mg Voriconazole 50mg tablets | 28 tablet £45.43–£275.68 DT price = £118.99
  - **Voriconazole** 200 mg Voriconazole 200mg tablets | 28 tablet £157.49–£1.102.74 DT price = £460.32
  - **VFEND** (Pfizer Ltd)
  - **Voriconazole** 50 mg VFEND 50mg tablets | 28 tablet £275.68 DT price = £118.99
  - **Voriconazole** 200 mg VFEND 200mg tablets | 28 tablet £1.102.74 DT price = £460.32

### Oral suspension

**CAUTIONARY AND ADVISORY LABELS** 9, 11, 23

- **VFEND** (Pfizer Ltd)
  - **Voriconazole** 40 mg per 1 ml VFEND 40mg/ml oral suspension | 75 ml £551.37
Poeder voor oplossing voor infusie
EXCIPIENTS: May contain Sucrose, ethanol, water.
ELECTROLYTES: May contain Sodium.
▶ Voriconazole (Non-proprietary)
Voriconazole 200 mg | Voriconazole 200mg powder for solution for infusion vials | 1 vial (Pfizer Ltd) | £51.43 + £77.14 (Hospital only)
▶ VFEND (Pfizer Ltd)
Voriconazole 200 mg | VFEND 200mg powder for solution for infusion vials | 1 vial (Pfizer Ltd) | £77.14 (Hospital only)
Power and solvent for solution for infusion
EXCIPIENTS: May contain Sucrose, ethanol, water.
ELECTROLYTES: May contain Sodium.
▶ VFEND (Pfizer Ltd)
Voriconazole 200 mg | VFEND 200mg powder and solvent for solution for infusion vials | 1 vial (Pfizer Ltd) | £77.14 (Hospital only)

**ANTIFUNGALS**

**Flucytosine**

**INDICATIONS AND DOSAGE**
Systemic yeast and fungal infections | Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections
▶ BY INTRAVENOUS INFUSION, OR BY MOUTH
- Neonate: 50 mg/kg every 12 hours.
- Child: Usual dose 50 mg/kg every 6 hours usually for not more than 7 days, alternatively 25–37.5 mg/kg every 6 hours usually for not more than 7 days, lower dose may be sufficient for sensitive organisms.

Cryptococcal meningitis (adjunct to amphotericin)
▶ BY INTRAVENOUS INFUSION, OR BY MOUTH
- Neonate: 50 mg/kg every 12 hours.
- Child: 25 mg/kg every 6 hours for 2 weeks.

**UNLICENSED USE**
Tablets not licensed.

**CAUTIONS**
Blood disorders.

**INTERACTIONS**
Appendix 1: flucytosine.

**SIDE-EFFECTS**
- Common or very common: Diarrhoea, nausea, rash, vomiting.
- Frequency not known: Aplastic anaemia - blood disorders - hepatic necrosis - hepatitis - leucopenia - thrombocytopenia.

**PREGNANCY**
Teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
Manufacturer advises avoid.

**RENAL IMPAIRMENT**
Use normal dose every 12 hours if creatinine clearance 20–40 mL/minute; use normal dose every 24 hours if creatinine clearance 10–20 mL/minute; use initial normal dose if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration. In renal impairment liver- and kidney-function tests and blood counts required weekly.

**MONITORING REQUIREMENTS**
- For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).
- Liver- and kidney-function tests and blood counts required (weekly in blood disorders).

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion, give over 20–40 minutes.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution.

**Solution for infusion**
ELECTROLYTES: May contain Sodium.
▶ Ancolit (Meda Pharmaceuticals Ltd)
Flucytosine 10 mg per 1 ml | Ancolit 2.5g/250ml solution for infusion bottles | 5 bottle (Hospital only)

**Griseofulvin**

**INDICATIONS AND DOSE**
Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate.
▶ BY MOUTH
- Child 1 month–11 years: Usual dose 10 mg/kg daily (max. per dose 500 mg), increased if necessary to 20 mg/kg daily (max. per dose 1 g), for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses.
- Child 12–17 years: 500 mg daily, increased if necessary to 1 g daily, for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses.

Tinea capitis caused by Trichophyton tonsurans
▶ BY MOUTH
- Child 1 month–11 years: 15–20 mg/kg once daily (max. per dose 1 g), alternatively 15–20 mg/kg daily in divided doses (max. per dose 1 g).
- Child 12–17 years: 1 g once daily, alternatively 1 g daily in divided doses.

**UNLICENSED USE**
Licensed for use in children (age range not specified by manufacturer).

**CONTRA-INDICATIONS**
Acute porphyrias p. 577 - systemic lupus erythematosus (risk of exacerbation).

**INTERACTIONS**
Appendix 1: griseofulvin.

**SIDE-EFFECTS**
- Rare: Erythema multiforme - toxic epidermal necrolysis.
- Very rare: Headache.

**CONCEPTION AND CONTRACEPTION**
Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration.

**PREGNANCY**
Avoid (fetotoxicity and teratogenicity in animals).

**BREAST FEEDING**
Avoid—no information available.

**HEPATIC IMPAIRMENT**
Avoid in severe liver disease.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks
May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
3.1 Pneumocystis pneumonia

Pneumocystis pneumonia

Overview
Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment
The recommended duration of treatment is generally 14–21 days.

Mild to moderate disease
Co-trimoxazole p. 335 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone below or a combination of dapsone p. 365 with trimethoprim p. 344 is given by mouth for the treatment of mild to moderate disease [unlicensed indication] in children who cannot tolerate co-trimoxazole.

A combination of clindamycin p. 313 and primaquine p. 381 may be used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease
Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 365 given by intravenous infusion is an alternative for children who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion. If there is clinical improvement after 7–10 days of intravenous therapy with pentamidine isetionate, patients can be switched to oral treatment (e.g. atovaquone) to complete 21 days treatment.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy
In moderate to severe pneumocystis infections associated with HIV infection, prednisolone p. 421 is given by mouth for 5 days (alternatively, hydrocortisone p. 420 may be given parenterally); the dose is then reduced over the next 16 days and then stopped. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis
Prophylaxis against pneumocystis pneumonia should be given to all children with a history of this infection, and to all HIV-infected infants aged 1 month–1 year. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised children. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the child has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Prophylaxis should also be given to infants aged 1 month–1 year who are suspected to be HIV-positive, or whose mothers had a viral load greater than 1000 HIV RNA copies/mL between 36 weeks' gestation and delivery; prophylaxis should be continued until HIV infection is excluded or until immunity recovers.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. Co-trimoxazole may be used in infants born to mothers with a high risk of transmission of infection.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in children unable to tolerate co-trimoxazole. It is effective but children may be prone to extrapulmonary infection. Alternatively, dapsone can be used.

### ANTIPROTOZOALS

#### Atovaquone

- **INDICATIONS AND DOSE**
  - Treatment of mild to moderate *Pneumocystis jirovecii (Pneumocystis carinii)* pneumonia in patients intolerant of co-trimoxazole
    - **BY MOUTH**
      - Child 1–2 months: 15–20 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
      - Child 3 months–1 year: 22.5 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
      - Child 2–17 years: 15–20 mg/kg twice daily (max. per dose 750 mg) for 14–21 days, dose to be taken with food, particularly high fat food

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Other causes of pulmonary disease should be sought and treated. Initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy)
- **INTERACTIONS** → Appendix 1: antimalarials
- **SIDE-EFFECTS** Anaemia · diarrhoea · fever · headache · hyponatraemia · insomnia · nausea · neutropenia · pruritus · rash · Stevens-Johnson syndrome · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Monitor more closely in hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. Monitor more closely in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - **CAUTIONARY AND ADVISORY LABELS** 21
      - Wellvone (GlaxoSmithKline UK Ltd)
        - Atovaquone 150 mg per 1 ml Wellvone 750mg/5ml oral suspension sugar-free | 226 ml [Pod] £486.37
Pneumocystis pneumonia 365

**Dapsone**

**INDICATIONS AND DOSE**
Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)
- **BY MOUTH**
  - Child 1 month–11 years: 2 mg/kg once daily (max. per dose 100 mg)
  - Child 12–17 years: 100 mg once daily

**Prophylaxis of Pneumocystis jirovecii (*Pneumocystis carinii*) pneumonia**
- **BY MOUTH**
  - Child: 2 mg/kg once daily (max. per dose 100 mg)

**UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia. Monotherapy not licensed for children for prophylaxis of *P. jirovecii* pneumonia.

**CAUTIONS** Anaemia (treat severe anaemia before starting)
- avoid in acute porphyrias p. 577
- cardiac disease
- G6PD deficiency
- pulmonary disease
- susceptibility to haemolysis

**INTERACTIONS** → Appendix 1: dapsone

**SIDE-EFFECTS**
- Rare Stevens–Johnson syndrome, toxic epidermal necrolysis
- Frequency not known: Agranulocytosis, allergic dermatitis, anorexia, dapsone syndrome, haemolysis, headache, hepatitis, insomnia, methaemoglobinemia, nausea, neuropathy, psychosis, tachycardia, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
Dapsone syndrome If dapsone syndrome occurs (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoaalbuminaemia, psychosis and death).

**PREGNANCY** Folic acid p. 546 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinemia reported in third trimester.

**BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.

**PATIENT AND CARER ADVICE**
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

<table>

</table>

**Dapsone (Non-proprietary)**
- **Dapsone 50 mg** Dapsone 50mg tablets | 28 tablet | £51.00 DT price = £40.77
- **Dapsone 100 mg** Dapsone 100mg tablets | 28 tablet | £105.07 DT price = £105.07

**Pentamidine isetionate**

**INDICATIONS AND DOSE**
Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)
- **BY INTRAVENOUS INFUSION**
  - Child: 4 mg/kg once daily for at least 7–10 days

**Prophylaxis of Pneumocystis jirovecii (*Pneumocystis carinii*) pneumonia (specialist use only)**
- **BY INHALATION OF NEBULISED SOLUTION**
  - Child 5–17 years: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

**Visceral leishmaniasis (specialist use only)**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 1–17 years: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

**Cutaneous leishmaniasis (specialist use only)**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 1–17 years: 4 mg/kg once daily on alternate days for a total of 7–10 injections

**UNLICENSED USE** Not licensed for prevention of pneumocystis pneumonia in children.

**CAUTIONS** Anaemia, bradycardia, coronary heart disease, history of ventricular arrhythmias, hyperglycaemia, hypertension, hypoglycaemia, hypokalaemia, hypomagnesaemia, hypotension, leucopenia, risk of severe hypotension following administration, thrombocytopenia

**INTERACTIONS** → Appendix 1: pentamidine

**SIDE-EFFECTS**
- Rare Skin reactions (muscle necrosis, discomfort, pain, induration, swelling, anaemia, shortness of breath)

**SPECIFIC SIDE-EFFECTS**
- When used by inhalation: Bronchoconstriction (may be prevented by prior use of bronchodilators)—cough, shortness of breath
- With intramuscular use or intravenous use: Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)

**PREGNANCY** Manufacturer advises avoid unless essential.

**BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**RENAL IMPAIRMENT** Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in life-threatening infection, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in less severe infection, use 4 mg/kg on alternate days for at least 14 doses.

**MONITORING REQUIREMENTS**
- Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
- Carry out laboratory monitoring according to product literature.

**DIRECTIONS FOR ADMINISTRATION**
- Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and never given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion,*
reconstitute 300 mg with 3–5 mL. Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL. Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.

Powder for injection (dissolved in water for injection) may be used for nebulisation.

**HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Pentacarinat (Sanofi) Pentamidine isetionate 300 mg Pentacarinat 300mg powder for solution for injection vials [5 vial] £158.86

---

### 4 Helminth infection

#### Helminth infections

**Specialist centres**

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

- **Birmingham** (0121) 424 0357
- **Scotland** Contact local Infectious Diseases Unit
- **Liverpool** (0151) 705 3100
- **London** 0845 155 5000 (treatment)

**Drugs for threadworms**

Anthelmintics are effective in threadworm (pinworms, Enterobius vermicularis) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 368 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

**Ascaricides (common roundworm infections)**

Mebendazole is effective against Ascaris lumbricoides and is generally considered to be the drug of choice.

Levamisole p. 367 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

**Drugs for tapeworm infections**

**Taenicides**

Niclosamide [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in Taenia solium infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 368 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is as effective as niclosamide.

**Hydatid disease**

Cysts caused by Echinococcus granulosus grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole p. 367 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to E. multilocularis is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

**Drugs for hookworms**

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative. Levamisole is also is also effective in children.

**Schistosomicides (bilharziasis)**

Adult Schistosoma haematobium worms live in the genito-urinary veins and adult S. mansoni in those of the colon and mesentery. S. japonicum is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

**Filaricides**

Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is effective against microfilariae and adults of Loa loa, Wuchereria bancrofti, and Brugia malayi. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazaine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy Loa loa infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin p. 367 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is very effective in onchocerciasis and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for onchocerciasis because of their toxicity.
Drugs for cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or tiabendazole (tiabendazole) by mouth [all unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

Drugs for strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from ‘special order’ manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

ANTHELMINTICS

Albendazole

**INDICATIONS AND DOSE**

**Chronic Strongyloides infection**

- **BY MOUTH**
- Child 2-17 years: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

**Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases**

- **BY MOUTH**
- Child 2-17 years: 7.5 mg/kg twice daily (max. per dose 400 mg twice daily) for 28 days followed by 14-day break, repeated for up to 2–3 cycles

**Hookworm infections**

- **BY MOUTH**
- Child 2-17 years: 400 mg for 1 dose

**UNLICENSED USE** Albendazole is an unlicensed drug.

**INTERACTIONS** Appendix 1: albendazole

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

**Tablet**

CAUTIONARY AND ADVISORY LABELS 9

- Albendazole (Non-proprietary)
  - Albendazole 400 mg Eskazole 400mg tablets | 60 tablet [PO] no price available

**Chewable tablet**

CAUTIONARY AND ADVISORY LABELS 9

- Albendazole (Non-proprietary)
  - Albendazole 200 mg Zentel 200mg chewable tablets | 6 tablet [PO] no price available
  - Albendazole 400 mg Zentel 400mg chewable tablets | 1 tablet [PO] no price available | 3 tablet [PO] no price available

Diethylcarbamazine

**INDICATIONS AND DOSE**

**Wuchereria bancrofti infections | Brugia malayi infections**

- **BY MOUTH**
- Child 1 month–9 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 3 mg/kg daily in divided doses, dose to be increased gradually over 3 days

**UNLICENSED USE** Diethylcarbamazine is an unlicensed drug.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

Ivermectin

17-May-2017

**INDICATIONS AND DOSE**

**Chronic Strongyloides infection**

- **BY MOUTH**
- Child 5-17 years: 200 micrograms/kg daily for 2 days

**Onchocerciasis**

- **BY MOUTH**
- Child 5-17 years: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months, depending on symptoms, must be given until adult worms die out

**Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone**

- **BY MOUTH**
- Child: (consult product literature)

**UNLICENSED USE** Ivermectin is unlicensed.

**INTERACTIONS** Appendix 1: ivermectin

**SIDE-EFFECTS** Aggravation of itching · aggravation of rash

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**

Ivermectin (Non-proprietary)

Ivermectin 3 mg Stromectol 3mg tablets | 4 tablet [PO] no price available | 20 tablet [PO] no price available

Levamisole

**INDICATIONS AND DOSE**

**Roundworm infections**

- **BY MOUTH**
- Child: 2.5–3 mg/kg (max. per dose 150 mg) for 1 dose

**Hookworm infections**

- **BY MOUTH**
- Child: 2.5 mg/kg (max. per dose 150 mg) for 1 dose, dose to be repeated after 7 days if severe

**Nephrotic syndrome (initiated under specialist supervision)**

- **BY MOUTH**
- Child: 2.5 mg/kg once daily on alternate days (max. per dose 150 mg)

**UNLICENSED USE** Not licensed.
CONTRA-INDICATIONS  Blood disorders

CAUTIONS  Epilepsy · juvenile idiopathic arthritis · Sjögren’s syndrome

INTERACTIONS  Appendix 1: levamisole

SIDE-EFFECTS  Arthralgia (on prolonged treatment) · blood disorders (on prolonged treatment) · convulsions (on prolonged treatment) · diarrhoea · dizziness · headache · influenza-like syndrome (on prolonged treatment) · insomnia (on prolonged treatment) · myalgia (on prolonged treatment) · nausea · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · urticaria

PREGNANCY  Embryotoxic in animal studies, avoid if possible.

BREAST FEEDING  No information available.

HEPATIC IMPAIRMENT  Use with caution—dose adjustment may be necessary.

PATIENT AND CARER ADVICE  Medicines for Children leaflet: Levamisole for nephrotic syndrome

www.medicinesforchildren.org.uk/mebendazole-for-worm-infections

INTERACTIONS

UNLICENSED USE  Not licensed for use as a single dose of 500 mg in roundworm infections. Not licensed for use in children under 2 years.

SIDE-EFFECTS

Common or very common  Abdominal pain

Uncommon  Diarrhoea · flatulence

Rare  Alopecia · convulsions · dizziness · hepatitis · neutropenia · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · urticaria

PREGNANCY  Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING  Amount present in milk too small to be harmful but manufacturer advises avoid.

PRESCRIBING AND DISPENSING INFORMATION  Flavours of oral liquid formulations may include banana.

PATIENT AND CARER ADVICE  Medicines for Children leaflet: Mebendazole for worm infections

www.medicinesforchildren.org.uk/mebendazole-for-worm-infections

EXCEPTIONS TO LEGAL CATEGORY  Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

MEDIINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

▶  Oval (McNeil Products Ltd)
  Mebendazole 20 mg per 1 ml  Oval 100mg/5ml oral suspension | 30 ml  £6.03 DT price = £1.55

▶  Vermox (Janssen-Cilag Ltd)
  Mebendazole 20 mg per 1 ml  Vermox 100mg/5ml oral suspension | 30 ml  £1.55 DT price = £1.55

Chewable tablet

▶  Oval (McNeil Products Ltd)
  Mebendazole 100 mg  Oval 100mg chewable tablets sugar-free | 1 tablet  £2.03 sugar-free | 4 tablet  £4.74

▶  Vermox (Janssen-Cilag Ltd)
  Mebendazole 100 mg  Vermox 100mg chewable tablets sugar-free | 6 tablet  £1.34 DT price = £1.34

Praziquantel

INDICATIONS AND DOSE

Tapeworm infections (Taenia solium)

▶  BY MOUTH
  Child 4-17 years: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

Tapeworm infections (Hymenolepis nana)

▶  BY MOUTH
  Child 4-17 years: 25 mg/kg for 1 dose, to be taken after a light breakfast

Schistosoma haematobium worm infections | Schistosoma mansoni worm infections

▶  BY MOUTH
  Child 4-17 years: 20 mg/kg, followed by 20 mg/kg after 4–6 hours

Schistosoma japonicum worm infections

▶  BY MOUTH
  Child 4-17 years: 20 mg/kg 3 times a day for 1 day

UNUSED USE  Praziquantel is an unlicensed drug.

INTERACTIONS  Appendix 1: praziquantel

MEDIINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

CAUTIONARY AND ADVISORY LABELS  4

▶  Ergamisol (Imported (Belgium))
  Levamisole (as Levamisole hydrochloride) 50 mg  Ergamisol 50mg tablets | 20 tablet  no price available

Mebendazole

INDICATIONS AND DOSE

Threadworm infections

▶  BY MOUTH
  Child 6 months–17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

Whipworm infections | Hookworm infections

▶  BY MOUTH
  Child 1-17 years: 100 mg twice daily for 3 days

Roundworm infections

▶  BY MOUTH
  Child 1 year: 100 mg twice daily for 3 days
  Child 2-17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

UNLICENSED USE  Not licensed for use as a single dose of 500 mg in roundworm infections. Not licensed for use in children under 2 years.

INTERACTIONS  Appendix 1: mebendazole

SIDE-EFFECTS

Common or very common  Abdominal pain

Uncommon  Diarrhoea · flatulence

Rare  Alopecia · convulsions · dizziness · hepatitis · neutropenia · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · urticaria

PREGNANCY  Manufacturer advises avoid—toxicity in animal studies.

5  Protozoal infection

Antiprotozoal drugs

Ameobicides

Metronidazole p. 319 is the drug of choice for acute invasive amoebic dysentery since it is very effective against vegetative forms of Entamoeba histolytica in ulcers. Tinidazole p. 320 is
also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate p. 287.

Diloxanide furoate is the drug of choice for asymptomatic patients with E. histolytica cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with large volumes of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

**Trichomonacides**

Metronidazole is the treatment of choice for Trichomonas vaginalis infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

**Antigiardial drugs**

Metronidazole is the treatment of choice for Giardia lamblia infections. Tinidazole may be used as an alternative to metronidazole.

**Leishmaniacides**

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Skin lesions can also be treated with sodium stibogluconate.

Amphotericin p. 357 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (Ambisome®; Abelcet®), a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isethionate p. 365 (pentamidine isethionate) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include pyrimethamine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

**Trypanocides**

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

**Drugs for toxoplasmosis**

Most infections caused by Toxoplasma gondii are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma choroidoretinitis), and those who are immunosuppressed. Toxoplasma encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 382 and sulfadiazine p. 336, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 313 or clarithromycin p. 315 or azithromycin p. 314. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus. When there is evidence of placental or fetal infection, pyrimethamine may be given with sulfadiazine and folinic acid p. 528 after the first trimester.

In neonates without signs of toxoplasmosis, but born to mothers known to have become infected, spiramycin is given while awaiting laboratory results. If toxoplasmosis is confirmed in the infant, pyrimethamine and sulfadiazine are given for 12 months, together with folinic acid.

---

**5.1 Leishmaniasis**

**Antiprotozoals**

**Sodium stibogluconate**

- **INDICATIONS AND DOSE**
  - Visceral leishmaniasis (specialist use only)
    - By intravenous injection, or by intramuscular injection
    - Child: 20 mg/kg daily for at least 20 days

- **UNLICENSED USE**
  - With intravenous use. Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS**
  - Heart disease (withdraw if conduction disturbances occur); mucocutaneous disease; predisposition to QT interval prolongation; treat intercurrent infection (e.g. pneumonia)

- **CAUTIONS, FURTHER INFORMATION**
  - Mucocutaneous disease. Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.

- **INTERACTIONS**
  - Appendix 1: sodium stibogluconate

- **SIDE-EFFECTS**
  - Rare: Bleeding from gums; bleeding from nose; fever; flushing; jaundice; rash; substernal pain; sweating; vertigo

  - Frequency not known: Abdominal pain; anaphylaxis; anorexia; arthralgia; coughing; diarrhea; ECG changes; headache; lethargy; myalgia; nausea; pain on intramuscular injection; pain on intravenous administration; pancreatitis; thrombosis on intravenous administration; vomiting

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - Use with caution.

- **RENAL IMPAIRMENT**
  - Avoid in significant impairment.

- **MONITORING REQUIREMENTS**
  - Monitor ECG before and during treatment.
5.2 Malaria

Antimalarials

Artemether with lumefantrine
Artemether with lumefantrine p. 377 is licensed for the treatment of acute non-complicated falciparum malaria.

Chloroquine
Chloroquine p. 379 is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil hydrochloride p. 381 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see Recommended regimens for prophylaxis against malaria p. 372).

Chloroquine is no longer recommended for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine p. 382, Malarone®, or Riamet®. It is still recommended for the treatment of non-falciparum malaria.

Mefloquine
Mefloquine p. 380 is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-resistant falciparum malaria (for details, see Recommended regimens for prophylaxis against malaria p. 372).

Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

Piperaquine with artemimol
Artemimol with piperaquine phosphate p. 377 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

Primaquine
Primaquine p. 381 is used to eliminate the liver stages of P. vivax or P. ovale following chloroquine treatment.

Proguanil
Proguanil hydrochloride is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 372).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil hydrochloride p. 378) is licensed for the treatment of acute uncomplicated falciparum malaria. Malarone® is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline p. 338. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine
Pyrimethamine p. 382 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine p. 382 is not recommended for the prophylaxis of malaria, but can be used in the treatment of falciparum malaria with (or following) quinine.

Quinine
Quinine is not suitable for the prophylaxis of malaria.

Quinine is used for the treatment of falciparum malaria or if the infective species is not known or if the infection is mixed (for details see Malaria, treatment p. 371).

Tetracyclines
Doxycycline is used in adults and children over 12 years for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or Malarone® (for details, see Recommended regimens for prophylaxis against malaria p. 372).

Malaria, prophylaxis

Prophylaxis against malaria
The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. Weight is a better guide than age. If in doubt obtain advice from specialist centre (see under Malaria, treatment p. 371).

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin p. 699 provide the most effective barrier protection against insects (infants should sleep with a mosquito net stretched over the cot or baby carrier); mats and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. Long sleeves and trousers worn after dusk also provide protection against bites.
Length of prophylaxis
In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 380) before travel into an endemic area; Malarone® or doxycycline p. 338 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for 4 weeks after leaving (except for Malarone® prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine p. 379 and proguanil hydrochloride p. 381 may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. Malarone® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or Malarone® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region
It is important to be aware that any illness that occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should go immediately to a doctor and specifically mention their exposure to malaria.

Epilepsy
Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without chloroquine resistance proguanil alone is recommended; in areas with chloroquine resistance, doxycycline or Malarone® may be considered.

Asplenia
Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment
Avoidance (or dosage reduction) of proguanil hydrochloride is recommended since it is excreted by the kidneys. Malarone® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73m². Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

Pregnancy
Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 546 (in doses greater than standard pregnancy prophylaxis) should be given for at least the first trimester. The centres listed (see Malaria, treatment, below) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed]. Malarone® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding
Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants
Travellers taking warfarin sodium p. 94 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment
Children and their carers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible. In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Specific recommendations
Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See also Recommended regimens for prophylaxis against malaria.

Important
Settled immigrants (or long-term visitors) to the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

Advice for travellers

Treatment

Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists. Choice will depend on the age of the child.

If the infective species is not known, or if the infection is mixed, initial treatment should be as for falciparum malaria with quinine p. 382, Malarone® (atovaquone with proguanil hydrochloride p. 378), or Riamet® (artemether with lumefantrine p. 377). Falciparum malaria can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by Plasmodium falciparum. In most parts of the world P. falciparum is now resistant to chloroquine p. 379 which should not therefore be given for treatment. Quinine, Malarone® (atovaquone with proguanil hydrochloride), or Riamet® (artemether with lumefantrine) can be given by mouth if the child can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the child is seriously ill or unable to take tablets. Mefloquine p. 380 is now rarely used for treatment because of concerns about resistance.

Oral quinine is well tolerated by children although the salts are bitter. Quinine is given by mouth together with or followed by clindamycin p. 313 [unlicensed indication] or, in children over 12 doxycycline p. 338.

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine p. 382 as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, Malarone®, or Riamet® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment.

If the child is seriously ill or unable to swallow tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by intravenous infusion [unlicensed] (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline in children over 12 years, or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named-patient' use.

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The treatment doses of oral and intravenous quinine (including the loading dose) can safely be given in pregnancy. Clindamycin [unlicensed indication] should be given for 7 days with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development in fetus); pyrimethamine with sulfadoxine, Malarone®, and Riamet® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired

</table>
in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named patient’ use.

Non-falciparum malaria (treatment)
Non-falciparum malaria is usually caused by Plasmodium vivax and less commonly by P. ovale and P. malariae. P. knowlesi is also present in the Asia-Pacific region. Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant P. vivax has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southeast Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, Malarone® [unlicensed indication], quinine, or Riamet® [unlicensed indication] can be used; as with chloroquine, primaquine p. 381 should be given for radical cure.

Chloroquine alone is adequate for P. malariae and P. knowlesi infections but in the case of P. vivax and P. ovale, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine.

For a radical cure, primaquine [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age.

Parenteral
If the child is unable to take oral therapy, quinine can be given by intravenous infusion, changed to oral chloroquine as soon as the patient’s condition permits.

Pregnancy
Treatment doses of chloroquine can be given for non-falciparum malaria. In the case of P. vivax or P. ovale, however, the radical cure with primaquine should be postponed until the pregnancy is over; instead chloroquine should be continued, given weekly, during the pregnancy.

ANTIPROTOZOALS > ANTIMALARIALS

Artemether with lumefantrine

INDICATIONS AND DOSE

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

BY MOUTH

Child (body-weight 5–14 kg): Initially 1 tablet, followed by 1 tablet for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours)

Child (body-weight 15–24 kg): Initially 2 tablets, followed by 2 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours)

Child (body-weight 25–34 kg): Initially 3 tablets, followed by 3 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)

Child 12–17 years (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)

UNLICENSED USE Use in treatment of non-falciparum malaria is an unlicensed indication.

CONTRA-INDICATIONS Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction

CAUTIONS Avoid in acute porphyrias p. 577 · electrolyte disturbances

SIDE-EFFECTS

Common or very common Abdominal pain · anorexia · arthralgia · asthenia · cough · diarrhoea · dizziness · headache · myalgia · nausea · palpitation · pruritus · rash · sleep disturbances · vomiting

PREGNANCY Toxicity in animal studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in animal studies.

HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment.

RENAL IMPAIRMENT Manufacturer advises caution in severe impairment. In severe renal impairment monitor ECG and plasma potassium concentration.

MONITORING REQUIREMENTS Monitor patients unable to take food (greater risk of recrudescence).

DIRECTIONS FOR ADMINISTRATION Tablets may be crushed just before administration.

PATIENT AND CARER ADVICE

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Riamet (Novartis Pharmaceuticals UK Ltd)

Artemether 20 mg, Lumefantrine 120 mg. Riamet tablets 24 tablet pack £22.50

Artemirol with piperaquine phosphate

(Piperaquine tetraphosphate with dihydroartemisinin)

INDICATIONS AND DOSE

Treatment of uncomplicated falciparum malaria

BY MOUTH

Child 6 months–17 years (body-weight 7–12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

Child 6 months–17 years (body-weight 13–23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

Child 6 months–17 years (body-weight 24–35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

Child 6 months–17 years (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

Child 6 months–17 years (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

CONTRA-INDICATIONS Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension

INTERACTIONS  Appendix 1: antimalarials

SIDE-EFFECTS

Common or very common Abdominal pain · anaemia · blood disorders · conjunctivitis · cough · diarrhoea · irregular
heart rate · leucopenia · malaise · QT interval prolonged · rash · thrombocytopenia · vomiting

- **Uncommon** Acanthosis · arrhythmias · arthralgia · convulsions · headache · heart murmur · hepatitis · hepatomegaly · influenza-like symptoms · jaundice · nausea · stomatitis

- **PREGNANCY** Teratogenic in animal studies—manufacturer advises use only if other antimalarials cannot be used.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.

- **RENAL IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.

- **MONITORING REQUIREMENTS**
  - Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QTc interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.
  - Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperinequine concentration, in children who are vomiting or in females.

- **DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperquine phosphate with artemenol.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - Eurartesim (Logixx Pharma Solutions Ltd) ▼
  - Artenmol 40 mg · Piperaquine phosphate 320 mg· Eurartesim 320mg/40mg tablets · 12 tablet (P60) £40.00

**Atovaquone with proguanil hydrochloride**

- **INDICATIONS AND DOSE**

  **MALARONE®**

  **Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected**

  - **BY MOUTH**
  - Child (body-weight 5–8 kg): 0.5 tablet once daily, to be started 1–3 days before entering endemic area and continued for 1 week after leaving
  - Child (body-weight 9–10 kg): 0.75 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
  - Child (body-weight 11–20 kg): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
  - Child (body-weight 21–30 kg): 2 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
  - Child (body-weight 31–40 kg): 3 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
  - Child (body-weight 41 kg and above): Use Malarone® (standard) tablets.

  **Treatment of acute uncomplicated falciparum malaria**

  - **BY MOUTH**
  - Child (body-weight 5–8 kg): 2 tablets once daily for 3 days
  - Child (body-weight 9–10 kg): 3 tablets once daily for 3 days
  - Child (body-weight 11–15 kg and above): Use Malarone® (standard) tablets.

- **UNLICENSED USE** Not licensed for treatment of non-falciparum malaria. Not licensed for prophylaxis of malaria in children under 11 kg.

- **CAUTIONS** Diarrhoea or vomiting (reduced absorption of atovaquone) · efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure)

- **INTERACTIONS** ▶ Appendix 1: antimalarials

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain · abnormal dreams · anorexia · cough · depression · diarrhoea · dizziness · fever · headache · insomnia · nausea · pruritus · rash · vomiting
  - Uncommon Anxiety · blood disorders · hair loss · hypotension · palpitation · stomatitis
  - Frequency not known Cholestasis · hallucinations · hepatitis · mouth ulcers · photosensitivity · seizures · Stevens-Johnson syndrome · tachycardia · vasculitis

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Use only if no suitable alternative available.

- **RENAL IMPAIRMENT** Avoid for malaria prophylaxis and, if possible, for treatment if estimated glomerular filtration rate less than 30 ml/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**

  **MALARONE® PAEDIATRIC** Tablets may be crushed and mixed with food or milky drink just before administration.

  **PATIENT AND CARER ADVICE** Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

Medicines for Children leaflet: Malarone for prevention of malaria www.medicinesforchildren.org.uk/malarone-for-prevention-of-malaria

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NHS restrictions** Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.
**INTERACTIONS**  → Appendix 1: antimalarials

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common**  Gastro-intestinal disturbances • headache • pruritus • rashes • skin reactions

- **Uncommon**  Convulsions • discolouration of mucous membranes • discolouration of nails • discolouration of skin • ECG changes • hair depigmentation • hair loss • keratopathy • otoxicity • retinal damage • visual changes

- **Rare**  Acute generalised exanthematous pustulosis • agranulocytosis • angioedema • aplastic anaemia • blood disorders • bone marrow suppression • cardiomyopathy • emotional disturbances • exfoliative dermatitis • hepatic damage • hypersensitivity reactions • mental changes • myopathy • neuromyopathy • photosensitivity • psychosis • Stevens-Johnson syndrome • thrombocytopenia • urticaria

- **Frequency not known**  Bronchospasm • diffuse parenchymal lung disease • drug rash with eosinophilia and systemic symptoms • extrapyramidal symptoms (associated with use in malaria) • hypotension • visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Malaria prophylaxis and treatment**  Serious skin reactions, ECG changes, visual effects, ototoxicity, blood disorders, mental changes, myopathies and hepatic damage are not usually associated with malaria prophylaxis or treatment.

**Overdose**

Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY**  Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.

- **BREAST FEEDING**  Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.

- **HEPATIC IMPAIRMENT**  Use with caution in moderate to severe impairment.

- **RENAL IMPAIRMENT**  Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose. Manufacturers advise caution.

- **MONITORING REQUIREMENTS**  Ophthalmic examination with long-term therapy.

- **PATIENT AND CARER ADVICE**  Warn travellers going to malarious areas about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

- **NATIONAL FUNDING/ACCESS DECISIONS**  Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY**  Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS**

- **Malarivon**  (Wallace Manufacturing Chemists Ltd)
  - Chloroquine phosphate 16 mg per 1 ml
  - Malarivon 80mg/5ml syrup
  - 75 ml £30.00

**Chloroquine**

**INDICATIONS AND DOSE**

**Prophylaxis of malaria**

- **INITIALLY BY MOUTH USING SYRUP**
  - Child 4-5 weeks (body-weight up to 4.5 kg): 25 mg once weekly and continued for 4 weeks after leaving
  - Child 6 weeks-5 months (body-weight 4.5-7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 6-11 months (body-weight 8-10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 1-2 years (body-weight 11-14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 3-4 years (body-weight 15-16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 5-7 years (body-weight 16.5-24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 8-13 years (body-weight 25-44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
  - **INITIALLY BY MOUTH USING TABLETS**
  - Child 14-17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

**TREATMENT of non-falciparum malaria**

- **BY MOUTH**
  - Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days

**P. vivax or P. ovale infection during pregnancy while radical cure is postponed**

- **BY MOUTH**
  - Child: 10 mg/kg once weekly (max. per dose 310 mg)

**DOSE EQUIVALENCE AND CONVERSION**

- Doses expressed as chloroquine base. Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx.).

**UNLICENSED USE**  Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

**CAUTIONS**  Acute porphyrias p. 577 • diabetes (may lower blood glucose) • GluCo deficiency • long-term therapy (regular ophthalmic examination recommended by manufacturers) • may aggravate myasthenia gravis • may exacerbate psoriasis • neurological disorders, especially epilepsy (avoid for prophylaxis of malaria if history of epilepsy) • severe gastro-intestinal disorders

**INTERACTIONS**  → Appendix 1: antimalarials
Protozoal infection

Chloroquine with proguanil

The properties listed below are those particular to the combination only. For the properties of the components please consider, chloroquine p. 379, proguanil hydrochloride p. 381.

- **INDICATIONS AND DOSE**
  - **Prophylaxis of malaria**
    - **BY MOUTH**
    - Child: (consult product literature)
  - **INTERACTIONS** → Appendix 1: antimalarials
  - **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Tablets**
- Paludrine/Avloclor (Alliance Pharmaceuticals Ltd)

- Chloroquine phosphate 250 mg Avloclor 250mg tablets
  - 20 tablet pack £7.95 0T price £7.95

- Paludrine/Avloclor tablets anti-malarial travel pack
  - 112 tablet pack £13.50

Mefloquine

- **INDICATIONS AND DOSE**
  - **Treatment of malaria**
    - **BY MOUTH**
    - Child: (consult product literature)
  - **Prophylaxis of malaria**
    - **BY MOUTH**
    - Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
    - Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
    - Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
    - Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

- **UNLICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature. Not licensed for use in children under 5 kg body-weight and under 3 months.

- **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions
  - avoid for standby treatment if history of convulsions
  - history of blackwater fever

- **CAUTIONS** Cardiac conduction disorders - epilepsy (avoid for prophylaxis) - not recommended in infants under 3 months (5 kg) - traumatic brain injury

- **CAUTIONS, FURTHER INFORMATION**
  - Neuropsychiatric reactions Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. For a prescribing checklist, and further information on side-effects, particularly neuropsychiatric side-effects, which may be associated with the use of mefloquine for malaria prophylaxis, see the Guide for Healthcare Professionals provided by the manufacturer.

- **INTERACTIONS** → Appendix 1: antimalarials

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - diarrhoea - dizziness - headache - nausea - neuropsychiatric reactions - pruritus - visual disturbances - vomiting
  - **Very rare** Optic neuropathy

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in animal studies).

- **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

- **BREAST FEEDING** Present in milk but risk to infant minimal.

- **HEPATIC IMPAIRMENT** Elimination may be prolonged; avoid in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

- **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.

- **PATIENT AND CARER ADVICE** A patient alert card should be provided. Manufacturer advises that patients receiving mefloquine for malaria prophylaxis should be informed to discontinue its use if neuropsychiatric symptoms occur and seek immediate medical advice so that mefloquine can be replaced with an alternative antimalarial. Travellers should also be warned about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

- **Driving and skilled tasks** Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.
Primaquine

**INDICATIONS AND DOSE**

Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection

- **BY MOUTH**
  - Child: 250 micrograms/kg daily (max. per dose 30 mg) for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P. ovale* infection

- **BY MOUTH**
  - Child: 250 micrograms/kg daily (max. per dose 15 mg) for 14 days

Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)

- **BY MOUTH**
  - Child: This combination is associated with considerable toxicity (consult product literature)

**UNLICENSED USE**

Not licensed.

**CAUTIONS**

6GPD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**INTERACTIONS**

- Appendix 1: antimalarials

**SIDE-EFFECTS**

- Common or very common: Abdominal pain - anorexia - nausea - vomiting

**PREGNANCY**

Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

**BREAST FEEDING**

No information available; theoretical risk of haemolysis in 6GPD-deficient infants.

**PRE-TREATMENT SCREENING**

Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (6GP6D) activity since the drug can cause haemolysis in 6GPD-deficient patients. Specialist advice should be obtained in 6GPD deficiency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- Primaquine (Non-proprietary)

Primaquine (as Primaquine phosphate) 15 mg

100 tablet (PMS) no price available
Pyrimethamine

**INDICATIONS AND DOSE**

Toxoplasmosis in pregnancy (in combination with sulfadiazine and folinic acid)
- **BY MOUTH**
  - Child 12-17 years: 50 mg once daily until delivery

Congenital toxoplasmosis (in combination with sulfadiazine and folinic acid)
- **BY MOUTH**
  - Neonate: 1 mg/kg twice daily for 2 days, then 1 mg/kg once daily for 6 months, then 1 mg/kg 3 times a week for 6 months.

**UNLICENSED USE**
Not licensed for use in children under 5 years.

**CAUTIONS**
- History of seizures—avoid large loading doses
- predisposition to folate deficiency

**INTERACTIONS**
- Appendix 1: antimalarials

**SIDE-EFFECTS**
- Common or very common
  - Anaemia (with high doses)
  - blood disorders (with high doses): diarrhoea, dizziness, headache, leucopenia
  - (with high doses): nausea, rash, thrombocytopenia
- Uncommon
  - Abnormal skin pigmentation, fever
- Very rare
  - Bucal ulceration, colic, convulsions

**PREGNANCY**
Theoretical teratogenic risk in first trimester (folate antagonist). Adequate folate supplements should be given to the mother.

**BREAST FEEDING**
Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution.

**RENAL IMPAIRMENT**
Manufacturer advises caution.

**MONITORING REQUIREMENTS**
Blood counts required with prolonged treatment.

**LESS SUITABLE FOR PRESCRIBING**
Pyrimethamine should not be used alone for malaria, but is used with sulfadoxine.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Tablet**
- Daraprim (GlaxoSmithKline UK Ltd)
  - Pyrimethamine 25 mg
  - Daraprim 25 mg tablets | 30 tablet £13.00

---

Pyrimethamine with sulfadoxine

**INDICATIONS AND DOSE**

Adjuant to quinine in treatment of Plasmodium falciparum malaria
- **BY MOUTH**
  - Child 1 month-4 years (body-weight 5 kg and above): 12.5/250 mg for 1 dose
  - Child 5-6 years: 25/500 mg for 1 dose
  - Child 7-9 years: 37.5/750 mg for 1 dose
  - Child 10-13 years: 50/1000 mg for 1 dose
  - Child 14-17 years: 75/1500 mg for 1 dose

Malaria prophylaxis
- **BY MOUTH**
  - Child: Not recommended by UK malaria experts

**DOSE EQUIVALENCE AND CONVERSION**

- Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of pyrimethamine and sulfadoxine respectively.

**UNLICENSED USE**
Not licensed for use in children of body-weight under 5 kg.

**CONTRA-INDICATIONS**
Acute porphyrias p. 577

**CAUTIONS**
- Asthma: avoid in blood disorders (unless under specialist supervision)
- avoid in infants under 6 weeks: G6PD deficiency—history of seizures—avoid large loading doses
- not recommended for prophylaxis (severe side-effects on long-term use)
- predisposition to folate deficiency

**INTERACTIONS**
- Appendix 1: antimalarials

**SIDE-EFFECTS**
- Common or very common
  - Diarrhoea; headache; hyperkalaemia; nausea; rash
  - Uncommon
  - Vomiting
  - Very rare
    - Anorexia; antibiotic-associated colitis; arthralgia; aseptic meningitis; ataxia; blood disorders; convulsions; cough; depression; eosinophilia; glossitis; hallucinations; hepatic necrosis; hypoglycaemia; hyponatraemia; interstitial nephritis; jaundice; leucopenia; liver damage; megaloblastic anaemia; myalgia; myocardiitis; pancreatitis; peripheral neuropathy; photosensitivity; renal disorders; rhabdomyolysis reported in HIV-infected patients; shortness of breath; Stevens-Johnson syndrome; stomatitis; systemic lupus erythematosus; thrombocytopenia; tinnitus; toxic epidermal necrolysis; uveitis; vasculitis; vertigo
- Frequency not known
  - Allergic alveolitis; eosinophilic alveolitis; pulmonary infiltrates

**SIDE-EFFECTS, FURTHER INFORMATION**
Discontinue immediately if blood disorders or rash occur. Discontinue if cough or shortness of breath occur.

**ALLERGY AND CROSS-SENSITIVITY**
Contra-indicated in patients with sulfonamide allergy.

**PREGNANCY**
Possible teratogenic risk in first trimester (pyrimethamine a folate antagonist); in third trimester—risk of neonatal haemolysis and methaemoglobinemia. Fear of increased risk of kernicterus in neonates appears to be unfounded.

**BREAST FEEDING**
Small risk of kernicterus in jaundiced infants; risk of haemolysis in G6PD-deficient infants (due to sulfadoxine)

**MONITORING REQUIREMENTS**
Monitor blood counts on prolonged treatment.

**PRESCRIBING AND DISPENSING INFORMATION**
Also known as Fansidar®.

**PATIENT AND CARER ADVICE**
Patients should be advised to maintain adequate fluid intake.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

---

Quinine

**INDICATIONS AND DOSE**

Non-falciparum malaria
- **BY INTRAVENOUS INFUSION**
  - Child: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Changed to oral chloroquine as soon as the patient’s condition permits
Falciparum malaria

- **BY MOUTH**
  - Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, together with or followed by either doxycycline (in children over 12 years), or clindamycin

- **BY INTRAVENOUS INFUSION**
  - Neonate: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can tolerate oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by clindamycin.

- Child: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by clindamycin (in children over 12 years), or clindamycin

Falciparum malaria (in intensive care unit)

- **BY INTRAVENOUS INFUSION**
  - Neonate: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by clindamycin.

- Child: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by clindamycin (in children over 12 years), or clindamycin

**DOSE EQUIVALENT AND CONVERSION**

- When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine.

- Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

**SIDE-EFFECTS**

- Acorrhoea, - confusion, - diaphoresis, - diaphoresis flushed skin, - headache, - hearing impairment, - hot skin, - hypersensitivity reactions, - hypoglycaemia (especially after parenteral administration), - intravascular coagulation, - muscle weakness, - nausea, - photosensitivity, - rash, - temporary blindness, - thrombocytopenia, - vertigo, - visual disturbances, - vomiting

**INTERACTIONS**

- **B**Blocker
- **C**Cardiac disease
- **E**Epilepsy
- **G**G6PD deficiency
- **O**Oedema
- **R**Renal failure
- **D**Diabetes

**CONTRA-INDICATIONS**

- Pregnancy
- Breast feeding
- Hepatic impairment
- Renal impairment

**MONITORING REQUIREMENTS**

- Monitor blood glucose and electrolyte concentration during parenteral treatment.

**DIRECTIONS FOR ADMINISTRATION**

- For *intravenous infusion*, dilute to a concentration of 2 mg/mL (max. 30 mg/mL in fluid restriction) with Glucose 5% or Sodium Chloride 0.9% and give over 4 hours.

**PRESCRIBING AND DISPENSING INFORMATION**

- Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

**UNLICENSED USE**

- Injection not licensed.

**CONTRA-INDICATIONS**

- Haemoglobinuria, - myasthenia gravis, - optic neuritis, - tinnitus

**CAUTIONS**

- Atrial fibrillation (monitor ECG during parenteral treatment), - cardiac disease (monitor ECG during parenteral treatment), - conduction defects (monitor ECG during parenteral treatment), - G6PD deficiency, - heart block (monitor ECG during parenteral treatment)

**INTERACTIONS**

- Appendix 1: antimalarials

**SIDE-EFFECTS**

- Agitation, - tinnitus, - abdominal pain, - acute renal failure, - angioedema, - blood disorders, - cardiovascular effects, - cinchonism, - confusion, - diarrhoea, - dyspnoea, - flushed skin, - headache, - hearing impairment, - hot skin, - hypersensitivity reactions, - hypoglycaemia (especially after parenteral administration), - intravascular coagulation, - muscle weakness, - nausea, - photosensitivity, - rash, - temporary blindness, - thrombocytopenia, - vertigo, - visual disturbances, - vomiting

**OVERDOSE**

- Quinine is very toxic in overdosage; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable). For details on the management of poisoning, see Emergency treatment of poisoning p. 803.

- **PREGNANCY**
  - High doses are teratogenic in first trimester, but in malaria benefit of treatment outweighs risk.

- **BREAST FEEDING**
  - Present in milk but not known to be harmful.

- **HEPATIC IMPAIRMENT**
  - For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

- **RENAL IMPAIRMENT**
  - For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

**ANTIBACTERIALS**

- Macrolides

- **Spiramycin**
  - **INDICATIONS AND DOSE**
    - **Toxoplasmosis in pregnancy**
      - **BY MOUTH**
    - Child 12–17 years: 1.5 g twice daily until delivery

  - **Chemoprophylaxis of congenital toxoplasmosis**
    - **BY MOUTH**
    - Neonate: 50 mg/kg twice daily.

  - **DOSE EQUIVALENT AND CONVERSION**
    - 3000 units = 1 mg spiramycin.

  - **UNLICENSED USE**
    - Not licensed.

**5.3 Toxoplasmosis**

*Other drugs used for Toxoplasmosis* Pyrimethamine, p. 382
6 Viral infection

6.1 Hepatitis

Overview
Treatment for viral hepatitis should be initiated by a specialist in hepatology or infectious diseases. The management of uncomplicated acute viral hepatitis is largely the domain of general practitioners or paediatricians. Specialist supervision is required for the management of chronic hepatitis B.

Chronic hepatitis B
Interferon alfa p. 529, peginterferon alfa-2a, lamivudine p. 401, adefovir dipivoxil, entecavir, and tenofovir disoprotil p. 402 have a role in the treatment of chronic hepatitis B in adults, but their role in children has not been well established. Specialist supervision is required for the management of chronic hepatitis B.

Tenofovir disoprotil, or a combination of tenofovir disoprotil with either emtricitabine p. 400 or lamivudine, may be used with other antiretrovirals, as part of “highly active antiretroviral therapy” in children who require treatment for both HIV and chronic hepatitis B. If children infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV. Management of these children should be coordinated between HIV and hepatology specialists.

Chronic hepatitis C
Treatment should be considered for children with moderate or severe liver disease. Specialist supervision is required and the regimen is chosen according to the genotype of the infecting virus and the viral load. A combination of ribavirin below with either interferon alfa or peginterferon alfa-2b is licensed for use in children over 3 years with chronic hepatitis C. A combination of peginterferon alfa p. 386 and ribavirin is preferred.

Other drugs used for Chronic hepatitis C Interferon alfa, p. 529

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ribavirin (Tribavirin)

INDICATIONS AND DOSE
Bronchiolitis
BY INHALATION OF AEROSOL, OR BY INHALATION OF NEBULISED SOLUTION
Child 1-23 months: Inhale a solution containing 20 mg/mL for 12–18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator
Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (administered on expert advice)
BY INTRAVENOUS INFUSION
Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

REBETOL® CAPSULES
Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation
BY MOUTH
Child 3-17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
Child 3-17 years (body-weight 47-49 kg): 200 mg, dose to be given in the morning and 400 mg, dose to be given in the evening
Child 3-17 years (body-weight 50-64 kg): 400 mg twice daily
Child 3-17 years (body-weight 65-80 kg): 400 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
Child 3-17 years (body-weight 81-104 kg): 600 mg twice daily
Child 3-17 years (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

REBETOL® ORAL SOLUTION
Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation
BY MOUTH
Child 3-17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
Child 3-17 years (body-weight 47-49 kg): 200 mg daily, dose to be given in the morning and 400 mg daily, dose to be given in the evening
Child 3-17 years (body-weight 50-64 kg): 400 mg twice daily
Child 3-17 years (body-weight 65-80 kg): 400 mg daily, dose to be given in the morning and 600 mg daily, dose to be given in the evening
Child 3-17 years (body-weight 81-104 kg): 600 mg twice daily
Child 3-17 years (body-weight 105 kg and above): 600 mg daily, dose to be given in the morning and 800 mg daily, dose to be given in the evening
UNLICENSED USE Inhalation licensed for use in children (age range not specified by manufacturer). Intravenous preparation not licensed.

CONTRA-INDICATIONS
- With systemic use Active severe psychiatric condition - autoimmune disease - autoimmune hepatitis - consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products - haemoglobinopathies - history of severe psychiatric condition - severe debilitating medical conditions - severe, uncontrolled cardiac disease in children with chronic hepatitis C

CAUTIONS
- When used by inhalation Maintain standard supportive respiratory and fluid management therapy
- With systemic use Cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) - consult product literature for specific cautions when ribavirin used in combination with other medicinal products - patients with a transplant—risk of rejection - risk of growth retardation in children, the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

INTERACTIONS → Appendix 1: ribavirin

SIDE-EFFECTS
- When used by inhalation Bacterial pneumonia - haemolytic - non-specific anaemia - pneumothorax - worsening respiration

SIDE-EFFECTS, FURTHER INFORMATION
- With oral use Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

CONCEPTION AND CONTRACEPTION
- With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
- When used by inhalation Women planning pregnancy should avoid exposure to aerosol.

PREGNANCY Avoid; teratogenicity in animal studies.
- When used by inhalation Pregnant women should avoid exposure to aerosol.

BREAST FEEDING Avoid—no information available.

HEPATIC IMPAIRMENT No dosage adjustment required. Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis

RENAI IMPAIRMENT Plasma-ribavirin concentration increased. Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.
- Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
- When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
- With systemic use Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature). Test thyroid function before treatment and then every 3 months.
- With oral use Eye examination recommended before treatment. Eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include bubble-gum.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Peginterferon alfa and ribavirin for chronic hepatitis C (November 2013) NICE TA300 Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children. www.nice.org.uk/TA300

LESS SUITABLE FOR PRESCRIBING Ribavirin inhalation is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution
CAUTIONARY AND ADVISORY LABELS 21
- Ribavirin 40 mg per 1 ml Ribavirin 40mg/ml oral solution | £3.80
- Ribavirin 100 mg per 1 ml Ribavirin 100mg/ml oral solution | £1.60

Capsule
CAUTIONARY AND ADVISORY LABELS 21
- Ribavirin 200 mg Ribavirin 200mg capsules | £16.00
- Ribavirin 400 mg Ribavirin 400mg capsules | £32.20

Solution for injection
- Virazole (Meda Pharmaceuticals Ltd)
- Ribavirin 100 mg per 1 ml Virazole 1.2g/12ml solution for injection vials | £6.00
POLYETHYLENE GLYCOL-CONJUGATED

Severe psychiatric illness
Avoid in severe impairment.
Respiratory symptoms
Viral infection
Manufacturers recommend avoid unless
(Roche Products Ltd)
Child 3

529
l
DRUG ACTION
Polyethylene glycol-conjugated (‘pegylated’) derivatives of interferon alfa (peginterferon alfa-2a and peginterferon alfa-2b) are available; pegylation increases the persistence of the interferon in the blood.

INDICATIONS AND DOSE
PEGASYS®
Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation
▶ BY SUBCUTANEOUS INJECTION
Child 5–17 years: (consult product literature)
VIRAFOREN peg®
Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation
▶ BY SUBCUTANEOUS INJECTION
Child 3–17 years: (consult product literature)

CONTRA-INDICATIONS
Severe psychiatric illness
CONTRA-INDICATIONS, FURTHER INFORMATION
For contra-indications consult product literature.

CAUTIONS
CAUTIONS, FURTHER INFORMATION
For cautions consult product literature.

INTERACTIONS
▶ Appendix 1: interferons

SIDE-EFFECTS
▶ Common or very common Anorexia, influenza-like symptoms, lethargy, nausea
▶ Frequency not known Alopecia, arrhythmias, cardiovascular problems, coma, confusion, depression, hepatotoxicity, hyperglycaemia, hypersensitivity reactions, hypertension, hypertriglyceridaemia (sometimes severe), hypotension, myelosuppression (particularly affecting granulocyte counts), nephrotoxicity, ocular side-effects, pneumonia, pneumonitis, psoriasisform rash, pulmonary infiltrates, reversible motor problems in young children, seizures, suicidal behaviour, thyroid abnormalities
SIDE-EFFECTS, FURTHER INFORMATION
For information on side effects consult product literature.
▶ Respiratory symptoms Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of peginterferon alfa should be considered.

CONCEPTION AND CONTRACEPTION
Effective contraception required during treatment—consult product literature.

PREGNANCY
Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).

BREAST FEEDING
Manufacturers advise avoid—no information available.

HEPATIC IMPAIRMENT
Avoid in severe impairment.

RENAL IMPAIRMENT
Reduce dose in moderate to severe impairment. For information on peginterferon alfa use in renal impairment consult product literature. Close monitoring required in renal impairment.

MONITORING REQUIREMENTS
▶ Monitoring of lipid concentration is recommended.
▶ Monitoring of hepatic function is recommended.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
▶ Peginterferon alfa and ribavirin for chronic hepatitis C (November 2013) NICE TA300
Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children.

Peginterferon alfa-2b 150 microgram Viraferon Peg 150 microgram powder and solvent for solution for injection pre-filled disposable devices CLEARCLICK | 1 pre-filled disposable injection [P] £199.38

6.3 Herpesvirus infections

Herpesvirus infections
Herpes simplex and varicella–zoster infection
The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.

Herpes simplex infections
Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.
In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. After completing parental treatment of neonatal herpes simplex, encephalitis, oral suppression therapy with aciclovir p. 387 for 6 months can be considered on specialist advice. Primary or recurrent genital herpes simplex infection is treated with
an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance. Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

**Varicella-zoster infections**
Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

In pregnancy severe chickenpox may cause complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Neonates and children who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease-specific Immunoglobulins). Prophylactic intravenous aciclovir should be considered for neonates whose mothers develop chickenpox 4 days before to 2 days after delivery.

In herpes zoster (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

**Choice**
Aciclovir is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed in adults for use in herpes zoster and genital herpes; there is limited information available on use in children.

Valaciclovir p. 389 is an ester of aciclovir, licensed in adults for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed in children over 12 years for preventing cytomegalovirus disease following solid organ transplantation. Valaciclovir may be used for the treatment of mild herpes zoster in immunocompromised children over 12 years; treatment should be initiated under specialist supervision.

**Cytomegalovirus infection**
Ganciclovir p. 389 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed under specialist supervision and only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. The use of ganciclovir may also be considered for symptomatic congenital CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 403; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load in those who receive the drug over a long duration.

Valaciclovir is licensed for use in children over 12 years for prevention of cytomegalovirus disease following renal transplantation.

Foscarnet sodium p. 390 is also active against cytomegalovirus; it is toxic and can cause renal impairment. It is deposited in teeth, bone and cartilage, and animal studies have shown that deposition is greater in young animals. Its effect on skeletal development in children is not known. Foscarnet sodium should be prescribed under specialist supervision.

### ANTIVIRALS > NUCLEOSIDE ANALOGUES

#### Aciclovir
(Acyclovir)

**INDICATIONS AND DOSE**

**Herpes simplex, suppression**
- **BY MOUTH**
  - Child 12–17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences.

**Herpes simplex, prophylaxis in the immunocompromised**
- **BY MOUTH**
  - Child 1–23 months: 100–200 mg 4 times a day
  - Child 2–17 years: 200–400 mg 4 times a day

**Herpes Simplex, treatment**
- **BY MOUTH**
  - Child 1–23 months: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
  - Child 2–17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

- **BY INTRAVENOUS INFUSION**
  - Neonate: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment).

  - Child 1–2 months: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)
  - Child 3 months-11 years: 250 mg/m² every 8 hours usually for 5 days
  - Child 12–17 years: 5 mg/kg every 8 hours usually for 5 days

**Herpes Simplex, treatment, in immunocompromised or if absorption impaired**
- **BY MOUTH**
  - Child 1–23 months: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
  - Child 2–17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
### Varicella zoster (chickenpox), treatment

**Herpes Simplex, treatment, in immunocompromised or in simplex encephalitis**
- **By intravenous infusion**
  - Child 3 months-11 years: 500 mg/m² every 8 hours usually for 5 days (given for at least 21 days in encephalitis—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)
  - Child 12-17 years: 10 mg/kg every 8 hours usually for 5 days (given for at least 14 days in encephalitis and for at least 21 days if also immunocompromised—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

**Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment**
- **By mouth**
  - Child 1-23 months: 200 mg 4 times a day for 5 days
  - Child 2-5 years: 400 mg 4 times a day for 5 days
  - Child 6-11 years: 800 mg 4 times a day for 5 days
  - Child 12-17 years: 800 mg 5 times a day for 7 days
- **By intravenous infusion**
  - Neonate: 10–20 mg/kg every 8 hours for at least 7 days.
  - Child 1-2 months: 10–20 mg/kg every 8 hours for at least 7 days
  - Child 3 months-11 years: 250 mg/m² every 8 hours usually for 5 days
  - Child 12-17 years: 5 mg/kg every 8 hours usually for 5 days

**Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised**
- **By intravenous infusion**
  - Child 3 months-11 years: 500 mg/m² every 8 hours usually for 5 days
  - Child 12-17 years: 10 mg/kg every 8 hours usually for 5 days

**Herpes zoster (shingles), treatment in immunocompromised**
- **By mouth**
  - Child 1-23 months: 200 mg 4 times a day continued for 2 days after crusting of lesions
  - Child 2-5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions
  - Child 6-11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
  - Child 12-17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions

**Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis**
- **By intravenous infusion**
  - Neonate: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised.
  - Child 1-2 months: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised
  - Child 3 months-11 years: 500 mg/m² every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised
  - Child 12-17 years: 10 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised

**Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated**
- **By mouth**
  - Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

**Varicella zoster (chickenpox), prophylaxis after delivery**
- **By intravenous infusion**
  - Neonate: 10 mg/kg every 8 hours continued until serological tests confirm absence of virus.

### Doses at Extremes of Body-Weight
- With intravenous use To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

#### Unlicensed use
- With oral use Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer). Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.

#### Caution
- Maintain adequate hydration (especially with infusion or high doses)

#### Interactions
- Appendix 1: aciclovir

#### Side-effects
- Common or very common Abdominal pain · diarrhoea · fatigue · headache · nausea · photosensitivity · pruritus · rash · urticaria · vomiting
- Very rare Acute renal failure · anaemia · ataxia · confusion · convulsions · dizziness · drowsiness · dysarthria · dysphonia · hallucinations · hepatitis · jaundice · leucopenia · neurological reactions · thrombocytopenia
- With intravenous use Agitation · fever · psychosis · severe local inflammation (sometimes leading to ulceration) · tremors

#### Pregnancy
- Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

#### Breast feeding
- Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

#### Renal Impairment
- With intravenous use Use normal intravenous dose every 12 hours if estimated glomerular filtration rate 25–50 mL/minute/1.73 m² (every 24 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m²).
  - Consult product literature for intravenous dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- With oral use For herpes zoster, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²). For herpes simplex, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
  - With systemic use Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

#### Directions for Administration
- For intravenous infusion, reconstitute to 25 mg/mL with Water for Injections or Sodium Chloride 0.9% then dilute to concentration of 5 mg/mL with Sodium Chloride 0.9% or Sodium Chloride and Glucose and give over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and central venous access and given over 1 hour.

#### Prescribing and Dispensing Information
- Flavours of oral liquid preparations may include banana, or orange.

#### Patient and Carer Advice
- Medicines for Children leaflet: Aciclovir (oral) for viral infections www.medicinesforchildren.org.uk/aciclovir-for-viral-infections
Valaciclovir

**INDICATIONS AND DOSE**

- **Herpes zoster infection, treatment in immunocompromised patients**
  - **BY MOUTH**
  - Child 12-17 years: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

**UNLICENSED USE**

Not licensed for treatment of herpes zoster in children. Not licensed for treatment or suppression of herpes simplex infection in immunocompromised or HIV-positive children.

**CAUTIONS**

Maintain adequate hydration (especially with high doses)

**INTERACTIONS**

Appendix 1: valaciclovir

**SIDE-EFFECTS**

- Very rare: Acute renal failure, anaemia, ataxia, confusion, convulsions, dizziness, drowsiness, dysarthria, dysphoae, hallucinations, hepatitis, jaundice, leucopenia, neurological reactions, thrombocytopenia.

- Frequency not known: Abdominal pain, diarrhoea, fatigue, headache, nausea, photosensitivity, pruritus, rash, urticaria, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Neurological reactions: Neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness) more frequent with higher doses.

**PREGNANCY**

Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

**BREAST FEEDING**

Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution with high doses used for preventing cytomegalovirus disease—no information available in children.

**RENAL IMPAIRMENT**

For herpes zoster, 1 g every 12 hours if estimated glomerular filtration rate
30–50 mL/minute/1.73 m² (1 g every 24 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²).

For treatment of herpes simplex, 500 mg (1 g in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

For treatment of herpes labialis, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose).

For suppression of herpes simplex, 250 mg (500 mg in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Reduce dose according to estimated glomerular filtration rate for cytomegalovirus prophylaxis following solid organ transplantation (consult product literature).

Maintain adequate hydration.

PRESCRIBING AND DISPENSING INFORMATION Valaciclovir is a pro-drug of aciclovir.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

6.3a Cytomegalovirus infections

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ganciclovir

INDICATIONS AND DOSE
Prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation

BY INTRAVENOUS INFUSION

Child: 5 mg/kg every 12 hours for 7–14 days

Treatment of life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only

BY INTRAVENOUS INFUSION

Child: Initially 5 mg/kg every 12 hours for 14–21 days, followed by maintenance 6 mg/kg daily on 5 days of the week, alternatively 5 mg/kg daily until adequate recovery of immunity, maintenance only for patients at risk of relapse of retinitis, if retinitis progresses initial induction treatment may be repeated

Congenital cytomegalovirus infection of the CNS

BY INTRAVENOUS INFUSION

Neonate: 6 mg/kg every 12 hours for 6 weeks.

UNLICENSED USE Not licensed for use in children.

CONTRA-INDICATIONS Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)

CAUTIONS Children (possible risk of long-term carcinogenic or reproductive toxicity) · ensure adequate hydration · history of cytopenia · potential carcinogen · potential teratogen · radiotherapy · vesicant

INTERACTIONS → Appendix 1: ganciclovir

SIDE-EFFECTS

Common or very common Abdominal pain · abnormal thinking · anaemia · anorexia · anxiety · arthralgia · chest pain · confusion · constipation · convulsions · cough · depression · dermatitis · diarrhoea · dizziness · dyspepsia · dysphagia · dysphonia · ear pain · eye pain · fatigue · flatulence · headache · hepatic dysfunction · infection · injection-site reactions · insomnia · leucopenia · macular oedema · myalgia · nausea · night sweats · pancytopenia · peripheral neuropathy · pruritus · pyrexia · renal impairment · retinal detachment · taste disturbance · thrombocytopenia · vitreous floaters · vomiting · weight loss

Uncommon Alopecia · anaphylactic reactions · arrhythmias · disturbances in hearing and vision · haematuria · hypotension · male infertility · mouth ulcers · pancreatitis · psychosis · tremor

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

PREGNANCY Avoid—teratogenic risk.

BREAST FEEDING Avoid—no information available.

RENAL IMPAIRMENT Reduce dose if estimated glomerular filtration rate less than 70 mL/minute/1.73 m²; consult product literature.

MONITORING REQUIREMENTS Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

DIRECTIONS FOR ADMINISTRATION Infuse into vein with adequate flow preferably using plastic cannula. For intravenous infusion, reconstitute with Water for Injections (500 mg/10 mL) then dilute to a concentration of not more than 10 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give over 1 hour.

HANDLING AND STORAGE
Caution in handling. Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion ELECTROLYTES: May contain Sodium

Ganciclovir (as Ganciclovir sodium) 500 mg Cymevene 500mg powder for solution for infusion vials | 5 vial [POM] £148.83

ANTIVIRALS > OTHER

Foscarnet sodium

INDICATIONS AND DOSE
Cytomegalovirus disease

BY INTRAVENOUS INFUSION

Child (under expert supervision): Initially 60 mg/kg every 8 hours 2–3 weeks, then maintenance 60 mg/kg daily,
6.4 HIV infection

HIV infection

Overview

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals.

The natural progression of HIV disease is different in children compared to adults; drug treatment should only be undertaken by specialists within a formal paediatric HIV clinical network. Guidelines and dose regimens are under constant review and for this reason some dose recommendations have not been included in BNF for Children.

Further information on the management of children with HIV can be obtained from the Children’s HIV Association (CHIVA) www.chiva.org.uk; and further information on antiretroviral use and toxicity can be obtained from the Paediatric European Network for Treatment of AIDS (PENTA) website penta-id.org/.

Principles of treatment

Treatment is aimed at suppressing viral replication for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and the child’s tolerance of treatment. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Initiation of treatment

Treatment is started in all HIV infected children under 1 year of age regardless of clinical and immunological parameters. In children over 1 year of age, treatment is based on the child’s age, CD4 cell count, viral load, and symptoms. The choice of antiviral treatment for children should take into account the method and frequency of administration, risk of side-effects, compatibility of drugs with food, palatability, and the appropriateness of the formulation. Initiating treatment with a combination of drugs (‘highly active antiretroviral therapy’ which includes 2 nucleoside reverse transcriptase inhibitors with either a non-nucleoside reverse transcriptase inhibitor or a boosted protease inhibitor) is recommended. Abacavir p. 397 and lamivudine p. 401 are the nucleoside reverse transcriptase inhibitors of choice for initial therapy; however, zidovudine p. 403 and lamivudine are used in children who are positive for the HLA-B*5701 allele. Nevirapine p. 395 is the preferred non-nucleoside reverse transcriptase inhibitor in children under 3 years of age, but efavirenz p. 394 is preferred in older children. Lopinavir with ritonavir p. 405 is the preferred boosted protease inhibitor for initial therapy. The metabolism of many antiretrovirals varies in young children; it may therefore be necessary to adjust the dose according to the plasma–drug concentration. Children who require treatment for both HIV and chronic hepatitis B should receive antivirals that are active against both diseases.

Switching therapy

Deterioration of the condition (including clinical, virological changes, and CD4 cell changes) may require a complete change of therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance, and the possibility of cross-resistance.

Pregnancy

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited),

increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

- BY INTRAVENOUS INFUSION
- Child (under expert supervision): 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

UNLICENSED USE Not licensed for use in children.

CAUTIONS Ensure adequate hydration

INTERACTIONS → Appendix 1: foscarnet

SIDE-EFFECTS

- Common or very common
  - Abdominal pain
  - Acute renal failure
  - Agitation
  - Anaemia
  - Anorexia
  - Anxiety
  - Changes in blood pressure
  - Changes in ECG
  - Confusion
  - Constipation
  - Convulsions
  - Depression
  - Diarrhoea
  - Dizziness
  - Dyspepsia
  - Dysuria
  - Electrolyte disturbances
  - Genital irritation and ulceration (due to high concentrations excreted in urine)
  - Granulocytopenia
  - Headache
  - Hepatic dysfunction
  - Hypocalcaemia
  - Hypokalaemia
  - Hypomagnesaemia
  - Leucopenia
  - Malaise
  - Myalgia
  - Nausea (reduce infusion rate)
  - Neurological disorders
  - Oedema
  - Palpitation
  - Pancreatitis
  - Parasthesia (reduce infusion rate)
  - Polyuria
  - Pruritus
  - Rash
  - Renal impairment
  - Thrombocytopenia
  - Thrombophlebitis if given undiluted by peripheral vein
  - Tremor
  - Vomiting

- Uncommon
  - Acidosis
  - Constipation
  - Fainting
  - Fever
  - Headache
  - Hypoglycaemia
  - Hypomagnesaemia
  - Nausea
  - Nystagmus
  - Palpitation
  - Rash
  - Rash with pruritus
  - Rash with urticaria
  - Severe headache
  - Severe renal impairment
  - Urinary tract infection
  - Vigilance

- Frequency not known
  - Diabetes insipidus
  - Myasthenia
  - Myositis
  - Oesophageal ulceration
  - Rhabdomyolysis
  - Ventricular arrhythmias

CONCEPTION AND CONTRACEPTION

Men should avoid fathering a child during and for 6 months after treatment.

PREGNANCY

Manufacturer advises avoid.

BREAST FEEDING

Avoid—present in milk in animal studies.

RENAL IMPAIRMENT

Reduce dose; consult product literature.

MONITORING REQUIREMENTS

- Monitor electrolytes, particularly calcium and magnesium.
- Monitor serum creatinine every second day during induction and every week during maintenance.

DIRECTIONS FOR ADMINISTRATION

Avoid rapid infusion. For intravenous infusion, give undiluted solution via a central venous catheter; alternatively dilute to a concentration of 12 mg/mL with Glucose 5% or Sodium Chloride 0.9% for administration via a peripheral vein; give over at least 1 hour (give doses greater than 60 mg/kg over 2 hours).

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- Electrolytes: May contain Sodium
  - Foscarnet sodium 24 mg per 1 ml Foscavir 6g/250ml solution for infusion bottles | 1 bottle £119.85 (Hospital only)
to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. All treatment options require careful assessment by a specialist. Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Local protocols and national guidelines (www.bhiva.org) should be consulted for recommendations on treatment during pregnancy and the perinatal period. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

Breast-feeding
Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Post-exposure prophylaxis
Children exposed to HIV infection through needlestick injury or by another route should be sent immediately to an accident and emergency department for post-exposure prophylaxis [unlicensed indication]. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Recommendations have been developed by the Children’s HIV Association, www.chiva.org.uk.

Drugs used for HIV infection
Zidovudine, a nucleoside reverse transcriptase inhibitor (or “nucleoside analogue”), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 398, emtricitabine p. 400, lamivudine, stavudine p. 402, and tenofovir disoproxil p. 402. There are concerns about renal toxicity and effects on bone mineralisation when tenofovir disoproxil is used in prepubertal children.

The protease inhibitors include atazanavir p. 404, darunavir p. 404, fosamprenavir p. 405 (a pro-drug of amprenavir), indinavir, lopinavir (available as lopinavir with ritonavir), ritonavir p. 406, and tipranavir p. 406. Indinavir is no longer recommended because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, lopinavir (available as lopinavir with ritonavir), and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 395 nevirapine and rilpivirine p. 396 are active against the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and rarely fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide below, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs. Enfuvirtide below should be combined with other potentially active antiretroviral drugs; it is given by subcutaneous injection. Maraviroc p. 407 is an antagonist of the CCR5 chemokine receptor. It is used in patients exclusively infected with CCR5–tropic HIV.

Dolutegravir p. 393 and raltegravir p. 393 are inhibitors of HIV integrase. They are used for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

Immune reconstitution syndrome
Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves’ disease) have also been reported many months after initiation of treatment.

Osteonecrosis
Osteonecrosis has been reported in children with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Neonates
In order to prevent transmission of infection, neonates born to HIV-positive mothers should be given post-exposure prophylaxis as soon as possible after birth, but starting no later than 72 hours after birth. Zidovudine p. 403 alone should be given to neonates whose mothers had a viral load less than 50 HIV RNA copies/mL between 36 weeks’ gestation and delivery, or whose mothers underwent caesarean section while taking zidovudine monotherapy. Combination antiretroviral therapy should be given to neonates whose mothers had a viral load over 50 HIV RNA copies/mL at delivery or whose mothers are found to be HIV positive after delivery. Prophylaxis is continued for 4 weeks.

ANTIVIRALS > HIV-FUSION INHIBITORS

Enfuvirtide

- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

- **INDICATIONS AND DOSE**
  - HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens
    - **BY SUBCUTANEOUS INJECTION**
      - Child 6-15 years: 2 mg/kg twice daily (max. per dose 90 mg)
      - Child 16-17 years: 90 mg twice daily

- **SIDE-EFFECTS**
  - **Common or very common** Acne • anorexia • anxiety • asthenia • conjunctivitis • diabetes mellitus • dry skin • erythema • gastro-oesophageal reflux disease • haematuria • hypertriglyceridaemia • impaired concentration • influenza-like illness • injection-site reactions • irritability • lymphadenopathy • myalgia • nightmares • pancreatitis • peripheral neuropathy • pneumonia • renal calculi • sinusitis • skin papilloma • tremor • vertigo • weight loss
  - **Uncommon** Hypersensitivity reactions
  - **Frequency not known** Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Hypersensitivity reactions**
  - hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.
Osteonecrosis For further information see HIV infection p. 391.

Pregnancy Manufacturer advises use only if potential benefit outweighs risk.

Hepatic Impairment Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).

Directions for Administration For subcutaneous injection, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.

Patient and Carer Advice Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

Medicinal Forms There can be variation in the licensing of different medicines containing the same drug.

Antivirals > HIV-Integrase Inhibitors

Dolutegravir 20-Nov-2015

Drug Action Dolutegravir is an inhibitor of HIV integrase.

Indications and Dose HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

- By Mouth
  - Child 12-17 years (body-weight 40 kg and above): 50 mg once daily

HIV infection in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)

- By Mouth
  - Child 12-17 years (body-weight 40 kg and above): 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

Interactions > Appendix 1: dolutegravir

Side-effects

Common or very common Abdominal pain · abnormal dreams · diarrhea · dizziness · fatigue · flatulence · headache · insomnia · nausea · pruritus · raised creatine kinase · rash · vomiting

Uncommon Hepatitis · hypersensitivity reactions

Frequency not known Osteonecrosis

Side-effects, Further Information

Hypersensitivity reactions Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

Osteonecrosis For further information see HIV infection p. 391.

Pregnancy Manufacturer advises use only if potential benefit outweighs risk.

Hepatic Impairment Manufacturer advises caution in severe impairment—no information available.

Directions for Administration Avoid antacids 6 hours before or 2 hours after taking dolutegravir.

Patient and Carer Advice Patients or carers should be given advice on how to administer dolutegravir tablets.

Missed doses If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

Medicinal Forms There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Tivicay (ViiV Healthcare UK Ltd) ▼
  - Dolutegravir (as Dolutegravir sodium) 10 mg  Tivicay 10 mg tablets | 30 tablet (PSt) £95.75
  - Dolutegravir (as Dolutegravir sodium) 25 mg  Tivicay 25 mg tablets | 30 tablet (PSt) £249.38
  - Dolutegravir (as Dolutegravir sodium) 50 mg  Tivicay 50 mg tablets | 30 tablet (PSt) £498.75

Combinations available: Abacavir with dolutegravir and lamivudine, p. 398

Raltegravir

Drug Action Raltegravir is an inhibitor of HIV integrase.

Indications and Dose HIV infection resistant to multiple antiretrovirals, in combination with other antiretroviral drugs

- By Mouth Using Tablets
  - Child 6-17 years (body-weight 25 kg and above): 400 mg twice daily
  - By Mouth Using Chewable Tablets
  - Child 2-11 years (body-weight 12-13 kg): 75 mg twice daily
  - Child 2-11 years (body-weight 14-19 kg): 100 mg twice daily
  - Child 2-11 years (body-weight 20-27 kg): 150 mg twice daily
  - Child 2-11 years (body-weight 28-39 kg): 200 mg twice daily
  - Child 2-11 years (body-weight 40 kg and above): 300 mg twice daily

Dose Equivalence and Conversion

The bioavailability of Isentress® chewable tablets is higher than that of the ‘standard’ 400 mg tablets; the chewable tablets are not interchangeable with the ‘standard’ tablets on a milligram-for-milligram basis.

Caution Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis

Interactions > Appendix 1: raltegravir

Side-effects

Common or very common Abdominal pain · abnormal dreams · asthenia · depression · diarrhea · dizziness · dyspepsia · flatulence · headache · hyperactivity · hypertriglyceridaemia · insomnia · nausea · rash · vomiting

Uncommon Acne · alopecia · anaemia · anxiety · appetite changes · arthralgia · bradycardia · carpal tunnel syndrome · chest pain · chills · confusion · constipation · drowsiness · dry mouth · dry skin · dysphonia · epistaxis · erectile dysfunction · flushing · gastritis · gingivitis · glossitis · gynaecomastia · hepatitis · hyperhidrosis · hypertension · impaired memory and attention · lipodystrophy · Lipodystrophy Syndrome · menopausal symptoms · myalgia · nasal congestion · neutropenia · nocturia · oedema · osteopenia · pain on swallowing · palpitation ·
pancreatitis · peptic ulcer · peripheral neuropathy · polydipsia · pruritus · pyrexia · rash with eosinophilia and systemic symptoms · rectal bleeding · renal failure · rhabdomyolysis · skin papilloma · Stevens–Johnson syndrome · suicidal ideation · taste disturbances · thrombocytopenia · tinnitus · tremor · ventricular extrasystoles · visual disturbances

- Frequency not known Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.
- Osteonecrosis For further information see HIV infection p. 391.

- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.

- HEPATIC IMPAIRMENT Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).

- PRESCRIBING AND DISPENSING INFORMATION Dispense raltegravir chewable tablets in original container (contains desiccant).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- By mouth using capsules

  - Child 3 months–17 years (body-weight 3.5–4 kg): 100 mg once daily
  - Child 3 months–17 years (body-weight 5–7.4 kg): 150 mg once daily
  - Child 3 months–17 years (body-weight 7.5–14 kg): 200 mg once daily
  - Child 3 months–17 years (body-weight 15–19 kg): 250 mg once daily
  - Child 3 months–17 years (body-weight 20–24 kg): 300 mg once daily
  - Child 3 months–17 years (body-weight 25–32.4 kg): 350 mg once daily
  - Child 3 months–17 years (body-weight 32.5–39 kg): 400 mg once daily
  - Child 3 months–17 years (body-weight 40 kg and above): 600 mg once daily

- By mouth using tablets

  - Child (body-weight 40 kg and above): 600 mg once daily

- By mouth using oral solution

  - Child 3–4 years (body-weight 13–14 kg): 360 mg once daily
  - Child 3–4 years (body-weight 15–19 kg): 390 mg once daily

- Child 3–4 years (body-weight 20–24 kg): 450 mg once daily

- Child 3–4 years (body-weight 25–32.5 kg): 510 mg once daily

- Child 5–17 years (body-weight 13–14 kg): 270 mg once daily

- Child 5–17 years (body-weight 15–19 kg): 300 mg once daily

- Child 5–17 years (body-weight 20–24 kg): 360 mg once daily

- Child 5–17 years (body-weight 25–32.4 kg): 450 mg once daily

- Child 5–17 years (body-weight 32.5–39 kg): 510 mg once daily

- Child 5–17 years (body-weight 40 kg and above): 720 mg once daily

**DOSE EQUIVALENCE AND CONVERSION**

- The bioavailability of Sustiva® oral solution is lower than that of the capsules and tablets; the oral solution is not interchangeable with either capsules or tablets on a milligram-for-milligram basis.

- Unlicensed use Opening capsules and adding contents to food is an unlicensed method of administration.

- Cautions Acute porphyrias p. 577 · history of psychiatric disorders · history of seizures

- Interactions → Appendix 1: efavirenz

**SIDE-EFFECTS**

- Common or very common Abdominal pain · abnormal dreams · anxiety · depression · diarrhoea · dizziness · fatigue · headache · impaired concentration · nausea · pruritus · rash · sleep disturbances · Stevens–Johnson syndrome · vomiting

- Uncommon Amnesia · ataxia · blurred vision · convulsions · flushing · gynaecomastia · hepatitis · hypersensitivity · mania · pancreatitis · psychosis · suicidal ideation · tinnitus · tremor · vertigo

- Rare Hepatic failure · photosensitivity · suicide

- Frequency not known Lipodystrophy syndrome · osteonecrosis · raised serum cholesterol

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

- CNS effects Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

- Osteonecrosis For further information see HIV infection p. 391.

- Immune Reconstitution Syndrome For further information see HIV infection p. 391.

- Pregnancy Reports of neural tube defects when used in first trimester.

- Hepatic impairment Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in severe impairment. In mild to moderate liver disease, monitor for dose-related side-effects (e.g. CNS effects) and liver function.

- Renal impairment Manufacturer advises caution in severe renal failure—no information available.

- Monitoring requirements Monitor liver function if receiving other hepatotoxic drugs.

- Directions for administration Capsules may be opened and contents added to food (contents have a peppery taste).

- Prescribing and dispensing information Flavours of oral liquid formulations may include strawberry and mint.

- Patient and carer advice Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms
such as severe depression, psychosis or suicidal ideation occur.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Etravirine**

**INDICATIONS AND DOSE**

**HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)**

- **BY MOUTH**
  - Child 6–17 years (body-weight 16–19 kg): 100 mg twice daily
  - Child 6–17 years (body-weight 20–24 kg): 125 mg twice daily
  - Child 6–17 years (body-weight 25–29 kg): 150 mg twice daily
  - Child 6–17 years (body-weight 30 kg and above): 200 mg twice daily

**CONTRA-INDICATIONS**
Acute porphyrias p. 577

**INTERACTIONS**
→ Appendix 1: etravirine

**SIDE-EFFECTS**

- **Common or very common**
  - Abdominal pain, anaemia, diabetes, flatulence, gastritis, gastro-oesophageal reflux, hyperlipidaemia, hypertension, lipodystrophy syndrome, nausea, peripheral neuropathy, rash, renal failure
- **Uncommon**
  - Blurred vision, bronchospasm, chest pain, drowsiness, dry mouth, dysgeusia, haematemesis, hepatitis, malaise, pancreatitis, sweating
- **Rare**
  - Stevens-Johnson syndrome
- **Very rare**
  - Toxic epidermal necrolysis
- **Frequency not known**
  - Haemorrhagic stroke, hypersensitivity reactions, osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hypersensitivity reactions: Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually within week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.
- Osteonecrosis: For further information see HIV infection p. 391.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.

**DIRECTIONS FOR ADMINISTRATION**
Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.

**PRESCRIBING AND DISPENSING INFORMATION**
Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**

**Hypersensitivity reactions**
Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

**Missed doses**
If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Nevirapine**

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs (initial dose)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child: Initially 150–200 mg/m² once daily (max. per dose 200 mg) for first 14 days, initial dose titration using ‘immediate-release’ preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the ‘immediate-release’ preparation for the first 14 days as for new treatment

**HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 1 month–2 years: 150–200 mg/m² twice daily (max. per dose 200 mg), alternatively 300–400 mg/m² once daily (max. per dose 400 mg)
  - Child 3–17 years: 150–200 mg/m² twice daily (max. per dose 200 mg)

**HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 3–17 years (body surface area 0.58–0.83 m²): 200 mg once daily
  - Child 3–17 years (body surface area 0.84–1.17 m²): 300 mg once daily
  - Child 3–17 years (body surface area 1.18 m² and above): 400 mg once daily

Hepatic effects

- Acute porphyrias
- Osteonecrosis

Females (at greater risk of hepatic side effects)

Manufacturer advises avoid modified-release tablets and suspension not licensed for once daily after the initial dose titration.

CONTRA-INDICATIONS

Acute porphyrias p. 577 - post-exposure prophylaxis

CAUTIONS

Females (at greater risk of hepatic side effects)

INTERACTIONS

Appendix 1: nevirapine

SIDE-EFFECTS

- Common or very common Abdominal pain • diarrhoea • fatigue • fever • granulocytopenia • headache • hepatitis • hypersensitivity reactions (may involve hepatic reactions and rash) • nausea • rash • Stevens-Johnson syndrome • toxic epidermal necrolysis • vomiting

- Uncommon Anaemia • arthralgia • myalgia

- Frequency not known Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

- Hepatic effects Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

- Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

- Osteonecrosis For more information see HIV infection p. 391.

HEPATIC IMPAIRMENT

Manufacturer advises avoid modified-release preparation—no information available; use ‘immediate-release’ preparation with caution in moderate impairment and avoid in severe impairment. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).

RENAI IMPAIRMENT

Manufacturer advises avoid modified-release preparation—no information available.

MONITORING REQUIREMENTS

- Hepatic disease Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.

- Rash Monitor closely for skin reactions during first 18 weeks.

PATIENT AND CARER ADVICE

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

- Viramune (Boehringer Ingelheim Ltd) Nevirapine (as Nevirapine hemihydrate) 10 mg per 1 ml Viramune 50mg/5ml oral suspension | 240 ml [Pom] £50.40

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

- Nevirapine (Non-proprietary)

Nevirapine 400 mg Nevirapine 400mg modified-release tablets | 30 tablet [Pom] £52.13-£161.50

- Viramune (Boehringer Ingelheim Ltd)

Nevirapine 100 mg Viramune 100mg modified-release tablets | 90 tablet [Pom] £127.50 (Hospital only)

Nevirapine 400 mg Viramune 400mg modified-release tablets | 30 tablet [Pom] £170.00 (Hospital only)

Tablet

- Nevirapine (Non-proprietary)

Nevirapine 200 mg Nevirapine 200mg tablets | 14 tablet [Pom] £33.69 | 60 tablet [Pom] £21.45-£170.00

- Viramune (Boehringer Ingelheim Ltd)

Nevirapine 200 mg Viramune 200mg tablets | 14 tablet [Pom] £39.67 | 60 tablet [Pom] £170.00

Rilpivirine

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than or equal to 100 000 copies/mL

BY MOUTH

- Child 12-17 years: 25 mg once daily

INTERACTIONS

Appendix 1: rilpivirine

SIDE-EFFECTS

- Abdominal pain • diarrhea • fatigue • fever • granulocytopenia • headache • hepatitis • hypersensitivity reactions • raised serum amylase • raised serum lipase • rash • sleep disturbances • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- Osteonecrosis For further information see HIV infection p. 391.

PREGNANCY

Manufacturer advises avoid unless essential—no information available.

HEPATIC IMPAIRMENT

Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.

RENAI IMPAIRMENT

Manufacturer advises caution in severe impairment.

DIRECTIONS FOR ADMINISTRATION

Avoid antacids 2 hours before or 4 hours after taking rilpivirine.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer rilpivirine tablets.

Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (October 2016) that Rilpivirine (Edurant®) is recommended as an option for use within NHS Wales in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in antiretroviral treatment-naïve patients from 12 years old to < 18 years old with a viral load < 100,000 HIV-1 RNA copies/ml.
Abacavir

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH**
  - Child 3 months–11 years: 8 mg/kg twice daily (max. per dose 300 mg), alternatively 16 mg/kg once daily (max. per dose 600 mg)
  - Child 3 months–11 years (body-weight 14–20 kg): 150 mg twice daily, alternatively 300 mg once daily
  - Child 3 months–11 years (body-weight 21–29 kg): 150 mg, taken in the morning and 300 mg, taken in the evening, alternatively 450 mg once daily
  - Child 3 months–11 years (body-weight 30 kg and above): 300 mg twice daily, alternatively 600 mg once daily
  - Child 12–17 years: 300 mg twice daily, alternatively 600 mg once daily

**INTERACTIONS**

- Appendix 1: abacavir

**SIDE-EFFECTS**

- Very rare Stevens-Johnson syndrome, toxic epidermal necrolysis
- Frequency not known Hypersensitivity reactions

**INDEXED FORMS**

- Oral solution
  - Excipients: May contain Propylene glycol
  - Abacavir (as Abacavir sulfate) 20 mg per 1 ml Abacavir 20 mg/ml oral solution sugar-free | 240 ml £47.36

- Tablet

Abacavir with dolutegravir and lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 397, lamivudine p. 401, dolutegravir p. 393.

- **INDICATIONS AND DOSE**
  - **HIV infection**
    - **BY MOUTH**
    - Child 12–17 years (body-weight 40 kg and above): 1 tablet once daily

- **INTERACTIONS** ➔ Appendix 1: abacavir, dolutegravir, lamivudine

- **RENAL IMPAIRMENT**
  - Avoid **Trizivir**® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE**
  - Missed doses
    - If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Tablet**
      - **Trizivir** (ViiV Healthcare UK Ltd) ▼
        - Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg **Trizivir** 50mg/600mg/300mg tablets | 30 tablet (PoM) £758.16

Abacavir with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 397, lamivudine p. 401.

- **INDICATIONS AND DOSE**
  - **HIV infection in combination with other antiretrovirals**
    - **BY MOUTH**
    - Child 12–17 years (body-weight 40 kg and above): 1 tablet once daily

- **INTERACTIONS** ➔ Appendix 1: abacavir, lamivudine

- **RENAL IMPAIRMENT**
  - Avoid **Kivexa**® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Tablet**
      - **Abacavir with lamivudine (Non-proprietary)**
        - Lamivudine 300 mg, Abacavir 600 mg **Abacavir 600mg / Lamivudine 300mg tablets | 30 tablet (PoM) £150.83–£249.41 | 30 tablet (PoM) £224.56 (Hospital only)
      - **Kivexa** (ViiV Healthcare UK Ltd)
        - Lamivudine 300 mg, Abacavir 600 mg **Kivexa** 600mg/300mg tablets | 30 tablet (PoM) £299.41

Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 397, lamivudine p. 401, zidovudine p. 403.

- **INDICATIONS AND DOSE**
  - **HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)**
    - **BY MOUTH**
    - Child (body-weight 30 kg and above): 1 tablet twice daily

- **UNLICENSED USE**
  - **Trizivir**® not licensed for use in children.

- **INTERACTIONS** ➔ Appendix 1: abacavir, lamivudine, zidovudine

- **RENAL IMPAIRMENT**
  - Avoid **Trizivir**® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Tablet**
      - **Trizivir** (ViiV Healthcare UK Ltd)
        - Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg **Trizivir tablets | 60 tablet (PoM) £432.70

Didanosine

(ddI; DDI)

- **INDICATIONS AND DOSE**
  - **HIV infection in combination with other antiretroviral drugs**
    - **BY MOUTH**
    - Child 1–7 months: 50–100 mg/m² twice daily
    - Child 8 months–17 years: 180–240 mg/m² once daily; usual dose 200 mg/m² once daily; maximum 400 mg per day

- **UNLICENSED USE**
  - Tablets not licensed for use in children under 3 months. EC capsules not licensed for use in children under 6 years.

- **CAUTIONS**
  - **History of pancreatitis (preferably avoid, otherwise extreme caution)**  - hyperuricaemia  - lactic acidosis  - peripheral neuropathy

CAUTIONS, FURTHER INFORMATION

- **Lactic acidosis**
  - Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with didanosine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

- **INTERACTIONS** ➔ Appendix 1: didanosine

- **SIDE-EFFECTS**
  - Acute renal failure  - alopecia  - anaphylactic reactions  - diabetes mellitus  - dry eyes  - dry mouth  - hyperuricaemia (suspend if raised significantly)  - hypoglycaemia  - lactic acidosis  - lipodystrophy  - liver failure  - non-cirrhotic portal hypertension  - optic nerve changes  - pancreatitis (less common in children)  - parotid gland enlargement  - peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops)  - retinal changes  - rhabdomyolysis  - sialadenitis

SIDE-EFFECTS, FURTHER INFORMATION

- **Pancreatitis**
  - Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible
avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

- Lipodystrophy syndrome Metabolic effects may occur with antiretroviral regimens containing didanosine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risks.

- HEPATIC IMPAIRMENT In hepatic impairment, monitor for pancreatitis monitor closely if elevated.

-renal impairment Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²; consult product literature.

- monitoring requirements Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.

- directions for administration Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.

With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets (child under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for taste; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir.

- patient and carer advice Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.

- medicinal forms There can be variation in the licensing of different medicines containing the same drug.

- gastro-resistant capsule

- cautionary and advisory labels 25

- Didanosine 125 mg Videx EC 125mg capsules 30 capsule £48.18 (Hospital only)

- Didanosine 200 mg Videx EC 200mg capsules 30 capsule £77.09 (Hospital only)

- Didanosine 250 mg Videx EC 250mg capsules 30 capsule £96.37 (Hospital only)

- Didanosine 400 mg Videx EC 400mg capsules 30 capsule £154.19 (Hospital only)

- chewable tablet

- cautionary and advisory labels 23

- excipients: May contain Aspartame

- Videx (Bristol-Myers Squibb Pharmaceuticals Ltd)

- Didanosine 25 mg Videx 25mg chewable dispersible tablets sugar-free 60 tablet £25.05 (Hospital only)

- interations → Appendix 1: cobicistat, elvitegravir, tenofovir

- side-effects → Uncommon Angioedema

- conception and contraception Manufacturer advises effective contraception in women of childbearing potential; if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol—no information available on progestogens other than norgestimate.

- hepatic impairment Manufacturer advises use with caution in mild-to-moderate impairment (greater risk of hepatic side-effects); avoid in severe impairment—no information available.

- renal impairment Manufacturer advises avoid if creatinine clearance less than 30 mL/minute—limited information available.

- prescribing and dispensing information Dispense in original container—contains desiccant.

- patient and carer advice Driving and skilled tasks Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of dizziness.

- national funding/access decisions

- Scottish medicines consortium (SMC) decisions

The Scottish medicines consortium (SMC) has advised (May 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (Genvoya®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

All Wales Medicines Strategy Group (AWMSG) decisions

The All Wales Medicines Strategy Group has advised (July 2016) that elvitegravir with cobicistat, emtricitabine and tenofovir alafenamide (Genvoya®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1 (HIV-1), without known mutations associated with resistance to the integrase inhibitor class, emtricitabine or tenofovir. The recommendation applies only if the approved Wales patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

Emtricitabine

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH USING CAPSULES**
  - Child (body-weight 33 kg and above): 200 mg once daily
  - Child 4 months-17 years (body-weight up to 33 kg): 6 mg/kg once daily
  - Child 4 months-17 years (body-weight 33 kg and above): 240 mg once daily

**DOSE EQUIVALENT AND CONVERSION**

- 240 mg oral solution = 200 mg capsule; where appropriate the capsule may be used instead of the oral solution.

**SIDE-EFFECTS**

- Abnormal dreams - hyperpigmentation - pruritus
- **HEPATIC IMPAIRMENT** On discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis).
- **RENAL IMPAIRMENT** Reduce dose or increase dosage interval if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include candy.
- **PATIENT AND CARER ADVICE**
  - Missed doses: If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

**ELECTROLYTES:** May contain Sodium

Emtricitabine with rilpivirine and tenofovir alafenamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine above, rilpivirine p. 396.

**INDICATIONS AND DOSE**

**HIV infection in patients with plasma HIV-1 RNA concentration of 100 000 copies/mL or less (specialist use only)**

- **BY MOUTH**
  - Child 12-17 years (body-weight 35 kg and above): 1 tablet once daily

**INTERACTIONS** → Appendix 1: rilpivirine, tenofovir

**SIDE-EFFECTS**

- Common or very common: Raised bilirubin
- Uncommon: Angioedema - dyspepsia - severe skin reactions (with systemic symptoms)

**SIDE-EFFECTS, FURTHER INFORMATION**

- Severe skin reactions: Systemic symptoms reported with severe skin reactions include fever, blisters, conjunctivitis, angioedema, elevated liver function tests, and eosinophilia.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in moderate impairment (greater risk of hepatic side-effects); avoid in severe impairment — no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 30 mL/minute — no information available.
- **PATIENT AND CARER ADVICE**
  - Vomiting: Manufacturer advises if vomiting occurs within 4 hours of taking a dose, a replacement dose should be taken.
  - Driving and skilled tasks: Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks — increased risk of dizziness.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (October 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (Odefsey®) is accepted for use within NHS Scotland for the treatment of human immunodeficiency virus type 1 (HIV-1), with non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

**All Wales Medicines Strategy Group (AWMSG) Decisions**

The All Wales Medicines Strategy Group has advised (November 2016) that emtricitabine with rilpivirine and tenofovir alafenamide (Odefsey®) is recommended as an option for use within NHS Wales for the treatment of human immunodeficiency virus type 1, with non-nucleoside reverse transcriptase inhibitor (NNRTI) class, tenofovir or emtricitabine, and with viral load HIV-1 RNA of 100 000 copies/mL or less.

(3TC)

- **INDICATIONS AND DOSE**
  **EPIVIR® ORAL SOLUTION**

  **HIV infection in combination with other antiretroviral drugs**

  - **BY MOUTH**
    - Child 1–2 months: 4 mg/kg twice daily
    - Child 3 months–11 years (body-weight up to 14 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg)
    - Child 3 months–11 years (body-weight 14–20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
    - Child 3 months–11 years (body-weight 21–29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg daily, dose to be taken in the morning and 150 mg daily, dose to be taken in the evening, alternatively 225 mg once daily

  - Child 3 months–11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily
  - Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily

---

**EPIVIR® TABLETS**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH**
  - Child 1–2 months: 4 mg/kg twice daily
  - Child 3 months–11 years (body-weight up to 14 kg): 4 mg/kg twice daily, alternatively 8 mg/kg once daily
  - Child 3 months–11 years (body-weight 14–20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
  - Child 3 months–11 years (body-weight 21–29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg once daily, alternatively 150 mg once daily
  - Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily

---

**ZEFFIX®**

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

- **BY MOUTH**
  - Child 2–11 years: 3 mg/kg once daily (max. per dose 100 mg), children receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection
  - Child 12–17 years: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

---

**UNLICENSED USE**

- **EPIVIR® ORAL SOLUTION** Not licensed for use in children under 3 months.
- **ZEFFIX®** Not licensed for use in children.
- **EPIVIR® TABLETS** Not licensed for use in children under 3 months.

- **CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

- **INTERACTIONS** ▶ Appendix 1: lamivudine

- **SIDE-EFFECTS** Alopecia • muscle disorders • nasal symptoms • peripheral neuropathy • rhabdomyolysis

- **BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature.

- **MONITORING REQUIREMENTS** When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every
3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and strawberry.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

EXCIPIENTS: May contain Sucrose

- **Epivir** (ViiV Healthcare UK Ltd)
  - Lamivudine 10 mg per 1 ml Epivir 50mg/5ml oral solution | 240 ml [PoM] £33.16

**Tablet**

- **Epivir** (ViiV Healthcare UK Ltd)
  - Lamivudine 150 mg Epivir 150mg tablets | 60 tablet [PoM] £121.82
  - Lamivudine 300 mg Epivir 300mg tablets | 30 tablet [PoM] £133.89
  - **Zeffix** (GlaxoSmithKline UK Ltd)
    - Lamivudine 100 mg Zeffix 100mg tablets | 28 tablet [PoM] £78.09

**Stavudine**

(d4T)

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

- **BY MOUTH**
  - Child (body-weight up to 30 kg): 1 mg/kg twice daily, to be taken preferably at least 1 hour before food
  - Child (body-weight 30–59 kg): 30 mg twice daily, to be taken preferably at least 1 hour before food
  - Child (body-weight 60 kg and above): 40 mg twice daily, to be taken preferably at least 1 hour before food

**UNLICENSED USE** Capsules not licensed for use in children under 3 months.

**CAUTIONS** Excessive alcohol intake · history of pancreatitis · history of peripheral neuropathy · lactic acidosis (especially when used in combination with didanosine)—use only if alternative regimens are not suitable

**CAUTIONS, FURTHER INFORMATION**

- Lactic acidosis Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with stavudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

**INTERACTIONS** → Appendix 1: stavudine

**SIDE-EFFECTS**

- Common or very common Abnormal dreams · cognitive dysfunction · depression · drowsiness · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · pruritus
- Uncommon Anxiety · gynaecomastia
- Frequency not known Lactic acidosis · lipodystrophy

**SIDE-EFFECTS, FURTHER INFORMATION**

- Lipodystrophy syndrome Metabolic effects may occur with antiretroviral regimens containing stavudine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**RENAI IMPAIRMENT** Reduce dose to 50% if estimated glomerular filtration rate 25–50 mL/minute/1.73 m²; reduce dose to 25% if estimated glomerular filtration rate less than 25 mL/minute/1.73 m². Risk of peripheral neuropathy.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

**LESS SUITABLE FOR PRESCRIBING** Stavudine (especially in combination with didanosine) is associated with a higher risk of lipatrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Zerit** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Stavudine 1 mg per 1 ml Zerit 1mg/ml oral solution | 200 ml [PoM] £22.94 (Hospital only)

**Capsule**

- **Zerit** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Stavudine 20 mg Zerit 20mg capsules | 56 capsule [PoM] £139.46 (Hospital only)
  - Stavudine 30 mg Zerit 30mg capsules | 56 capsule [PoM] £146.25 (Hospital only)
  - Stavudine 40 mg Zerit 40mg capsules | 56 capsule [PoM] £150.66 (Hospital only)

**Tenofovir disoproxil**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs when first-line nucleoside reverse transcriptase inhibitors cannot be used because of resistance or contra-indications

- **BY MOUTH**
  - Child 2–17 years: 6.5 mg/kg once daily (max. per dose 245 mg)
  - Child 6–17 years (body-weight 17–21 kg): 123 mg once daily
  - Child 6–17 years (body-weight 22–27 kg): 163 mg once daily
  - Child 6–17 years (body-weight 28–34 kg): 204 mg once daily
  - Child 6–17 years (body-weight 35 kg and above): 245 mg once daily

**Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histology of active liver inflammation or fibrosis)**

- **BY MOUTH**
  - Child 12–17 years (body-weight 35 kg and above): 245 mg once daily

**DOSE EQUVALENCE AND CONVERSION**

- 7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

**INTERACTIONS** → Appendix 1: tenofovir

**SIDE-EFFECTS**

- Rare Nephrogenic diabetes insipidus · proximal renal tubulopathy · renal failure
- Frequency not known Hypophosphataemia · reduced bone density

**RENAI IMPAIRMENT** Manufacturer advises avoid—no information available.
HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

- **BY INTRAVENOUS INFUSION**
  - Child: 3 months–11 years: 60–80 mg/m² every 6 hours usually for not more than 2 weeks, dose approximating to 9–12 mg/kg twice daily by mouth
  - Child: 12–17 years: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

### CONTRA-INDICATIONS
Abnormally low haemoglobin concentration (consult product literature) • Abnormally low neutrophil counts (consult product literature) • Acute porphyrias p. 577 • Neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature)

### CAUTIONS
- Lactic acidosis • Risk of haematological toxicity especially with high dose and advanced disease • Vitamin B12 deficiency (increased risk of neutropenia)

### FURTHER INFORMATION
- Lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with zidovudine. Use with caution in patients with hepatomegaly, hepatitis, or other risk factors for liver disease and hepatic steatosis (including obesity and alcohol abuse). Discontinue treatment if symptoms of hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function become apparent.

### INTERACTIONS
- Appendix 1: zidovudine

### SIDE-EFFECTS
- Anaemia (may require transfusion) • Anxiety • Chest pain • Convulsions • Depression • Dizziness • Drowsiness • Gynaecomastia • Influenza-like symptoms • Lactic acidosis • Lipodystrophy • Loss of mental acuity • Myopathy • Neuropathy • Parasthesia • Pigmentation of nails • Pigmentation of oral mucosa • Pigmentation of skin • Pruritus • Sweating • Taste disturbance • Urinary frequency

### FURTHER INFORMATION
- Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment.
- Lipodystrophy syndrome Metabolic effects may occur with antiretroviral regimens containing zidovudine; these include fat redistribution, insulin resistance, and dyslipidaemia—collectively termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting treatment, after 3–6 months of treatment, and then annually.

### HEPATIC IMPAIRMENT
Accumulation may occur.

### RENAL IMPAIRMENT
Reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²—consult product literature.

### MONITORING REQUIREMENTS
Monitor full blood count after 4 weeks of treatment, then every 3 months.

### DIRECTIONS FOR ADMINISTRATION
- For intermittent intravenous infusion, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

### PRESCRIBING AND DISPENSING INFORMATION
The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

#### Granules
Granules
- **CAUTIONARY AND ADVISORY LABELS**
  - **Viread** (Gilead Sciences International Ltd)
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 33 mg per gram

#### Tablet
- **CAUTIONARY AND ADVISORY LABELS**
  - **Viread** (Gilead Sciences International Ltd)
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 123 mg
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 163 mg
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 204 mg
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg

---

### Zidovudine
(Azidothymidine; AZT)

#### INDICATIONS AND DOSE
- **BY MOUTH**
  - Child: 180 mg/m² twice daily (max. per dose 300 mg)
  - Child (body-weight 8–13 kg): 100 mg twice daily
  - Child (body-weight 14–20 kg): 100 mg, to be taken in the morning and 200 mg, to be taken in the evening
  - Child (body-weight 21–27 kg): 200 mg twice daily
  - Child (body-weight 28–29 kg): 200–250 mg twice daily
  - Child (body-weight 30 kg and above): 250–300 mg twice daily

#### HIV infection in combination with other antiretroviral drugs (dose expressed in mg/kg)
- **BY MOUTH**
  - Child (body-weight 4–8 kg): 12 mg/kg twice daily
  - Child (body-weight 9–29 kg): 9 mg/kg twice daily

#### Prevention of maternal-fetal HIV transmission
- **BY MOUTH**
  - Child: Seek specialist advice (combination therapy preferred) (consult local protocol)

---

### Monitoring Requirements
- Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
- When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

### Directions for Administration
Granules: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.

### Patient and Carer Advice
Patients or carers should be given advice on how to administer tenofovir granules.

Missed doses
If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

---

*BNFC 2017–2018*
Zidovudine with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, zidovudine p. 403, lamivudine p. 401.

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- **CONTRA-INDICATIONS** Acute porphyrias p. 577
- **CAUTIONS** Haemophilia (increased risk of bleeding)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Zidovudine 10 mg per 1 ml**
  Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial (POM) £44.61

**Oral solution**

- **Zidovudine 10 mg per 1 ml**
  Retrovir 50mg/5ml oral solution sugar-free | 200 ml (POM) £17.78

**Capsule**

- **Zidovudine (Non-proprietary)**
  Zidovudine 100 mg Zidovudine 100mg capsules | 60 capsule (POM) no price available
  Zidovudine 250 mg Zidovudine 250mg capsules | 60 capsule (POM) no price available

- **Retrovir (Viiv Healthcare UK Ltd)**
  Zidovudine 100 mg Retrovir 100mg capsules | 100 capsule (POM) £88.86
  Zidovudine 250 mg Retrovir 250mg capsules | 40 capsule (POM) £88.86

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Osteonecrosis** For further information see HIV infection p. 391.
- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

**Atazanavir**

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**

- **BY MOUTH**
  - Child 6-17 years (body-weight 15-19 kg): 150 mg once daily
  - Child 6-17 years (body-weight 20-39 kg): 200 mg once daily
  - Child 6-17 years (body-weight 40 kg and above): 300 mg once daily

**CAUTIONS** Cardiac conduction disorders - electrolyte disturbances - predisposition to QT interval prolongation

**INTERACTIONS** → Appendix 1: HIV–protease inhibitors

**SIDE-EFFECTS**

- **Common or very common** AV block
- **Uncommon** Abnormal dreams - alopecia - amnesia - anxiety - arthralgia - chest pain - cholelithiasis - depression - disorientation - dry mouth - dyspnoea - gynaecomastia - haematuria - hypertension - increased appetite - mouth ulcers - nephrolithiasis - peripheral neuropathy - proteinuria - syncope - torsade de pointes - urinary frequency - weight changes
- **Rare** Abnormal gait - choleciytis - hepatitis - oedema - palpitation

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Rash** Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.
- **PREGNANCY** Theoretical risk of hyperbilirubinaemia in neonate if used at term. Monitor viral load and plasma-atazanavir concentration during third trimester.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Retrovir IV**
  - Zidovudine (as Zidovudine sulfate) 150 mg Capsule | 60 capsule (POM) £303.38 (Hospital only)
  - Zidovudine (as Zidovudine sulfate) 200 mg Capsule | 60 capsule (POM) £303.38 (Hospital only)

- **Reyataz (Bristol-Myers Squibb Pharmaceuticals Ltd)**
  - Atazanavir (as Atazanavir sulfate) 150 mg Capsule | 60 capsule (POM) £303.38 (Hospital only)
  - Atazanavir (as Atazanavir sulfate) 200 mg Capsule | 60 capsule (POM) £303.38 (Hospital only)

**ATIVIRALS PROTEASE INHIBITORS**

**Protease inhibitors**

- **CONTRA-INDICATIONS** Acute porphyrias p. 577
- **CAUTIONS** Haemophilia (increased risk of bleeding)

**Darunavir**

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs—in patients previously treated with antiretroviral therapy—with low-dose ritonavir**

- **BY MOUTH**
  - Child 3-17 years (body-weight 15-29 kg): 375 mg twice daily
  - Child 3-17 years (body-weight 30-39 kg): 450 mg twice daily
Child 3–17 years (body-weight 40 kg and above): 600 mg twice daily

Child 12–17 years: 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV–RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10^9/Litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

BY MOUTH

Child 12–17 years (body-weight 40 kg and above): 800 mg once daily

INTERACTIONS ➔ Appendix 1: HIV-protease inhibitors

SIDE-EFFECTS

Common or very common Peripheral neuropathy · rash

Uncommon Abnormal dreams · acne · alopecia · anxiety · arthralgia · chest pain · conjunctival hyperaemia · cough · depression · dry eyes · dry mouth · dyspnoea · dysuria · eczema · erectile dysfunction · flushing · gynaecomastia · hypertension · hypothyroidism · increased appetite · increased sweating · memory impairment · myoccardial infarction · nail discoloration · nephrolithiasis · osteoporosis · peripheral oedema · polyuria · pyrexia · QT interval prolongation · reduced libido · renal failure · severe skin rash · Stevens-Johnson syndrome · stomatitis · tachycardia · throat irritation · toxic epidermal necrolysis · weight changes

Rare Bradycardia · confusion · convulsions · haematemesis · palpitation · rhinorrhoea · seborrhoeic dermatitis · syncope · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Rash Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.

ALLERGY AND CROSS-SENSITIVITY Use with caution in patients with sulfonamide sensitivity.

PREGNANCY Manufacturer advises use only if potential benefit outweighs risks; if required, use the twice daily dose regimen.

HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.

MONITORING REQUIREMENTS Monitor liver function before and during treatment.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include strawberry.

PATIENT AND CARER ADVICE

Missed doses If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

Prezista (Janssen-Cilag Ltd)

Darunavir (as Darunavir ethanolate) 100 mg per 1 ml Prezista 100mg/ml oral suspension sugar-free | 200 ml (POM) £248.17

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Prezista (Janssen-Cilag Ltd)

Darunavir (as Darunavir ethanolate) 75 mg Prezista 75mg tablets | 480 tablet (POM) £446.70

Fosamprenavir

DRUG ACTION Fosamprenavir is a pro-drug of amprenavir.

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

BY MOUTH

Child 6–17 years (body-weight 25–39 kg): 18 mg/kg twice daily (max. per dose 700 mg)

Child 6–17 years (body-weight 40 kg and above): 700 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

INTERACTIONS ➔ Appendix 1: HIV-protease inhibitors

SIDE-EFFECTS

Rare Stevens-Johnson syndrome

Frequency not known Rash

SIDE-EFFECTS, FURTHER INFORMATION

Rash Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines.

PREGNANCY Toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk.

HEPATIC IMPAIRMENT Reduce dose in moderate to severe impairment. Manufacturer advises caution in mild impairment.

DIRECTIONS FOR ADMINISTRATION In children, oral suspension should be taken with food.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

EXCIPIENTS: May contain Propylene glycol

Telzir (ViiV Healthcare UK Ltd)

Fosamprenavir (as Fosamprenavir calcium) 50 mg per 1 ml Telzir 50mg/ml oral suspension | 225 ml (POM) £58.70

Tablet

Telzir (ViiV Healthcare UK Ltd)

Fosamprenavir (as Fosamprenavir calcium) 700 mg Telzir 700mg tablets | 60 tablet (POM) £220.13

Lopinavir with ritonavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

BY MOUTH USING TABLETS

Child 2–17 years (body-weight up to 40 kg and body surface area 0.5–0.7 m²): 200/50 mg twice daily continued →
Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies).

HEPATIC IMPAIRMENT
Avoid oral solution due to propylene glycol content; manufacturer advises avoid tablets in severe impairment.

RENAL IMPAIRMENT
Avoid oral solution due to high propylene glycol content.

MONITORING REQUIREMENTS
Monitor liver function before and during treatment.

PATIENT AND CARER ADVICE
Oral solution tastes bitter.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral solution
CAUTIONARY AND ADVISORY LABELS 21
EXCIPIENTS: May contain Alcohol, propylene glycol
- Kaletra (AbbVie Ltd)
  Ritonavir 20 mg per 1 ml, Lopinavir 80 mg per 1 ml
  Kaletra 80mg/20mg/1ml oral solution | 300 ml £307.39

Tablet
CAUTIONARY AND ADVISORY LABELS 25
- Kaletra (AbbVie Ltd)
  Ritonavir 25 mg, Lopinavir 100 mg
  Kaletra 100mg/25mg tablets | 60 tablet £76.85
  Ritonavir 50 mg, Lopinavir 200 mg
  Kaletra 200mg/50mg tablets | 120 tablet £285.41

Ritonavir

INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)
- BY MOUTH
  - Child 2-17 years: Initially 250 mg/m² twice daily, increased in steps of 50 mg/m² every 2–3 days; increased to 350 mg/m² twice daily (max. per dose 600 mg twice daily), tolerability of this regimen is poor
  - Low-dose ritonavir to increase the effect of atazanavir
  - BY MOUTH
    - Child 6-17 years (body-weight 15–19 kg): 80–100 mg once daily

CAUTIONS
Cardiac conduction disorders - pancreatitis - structural heart disease

INTERACTIONS → Appendix 1: HIV-protease inhibitors

SIDE-EFFECTS
- Common or very common
  - Amenorrhoea - anxiety - arthralgia - colitis - hypertension - menorrhagia - neuropathy - night sweats - sexual dysfunction - weight changes
- Uncommon

SIDE-EFFECTS, FURTHER INFORMATION
- Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

PREGNANCY
Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies).

HEPATIC IMPAIRMENT
Avoid oral solution due to propylene glycol content; manufacturer advises avoid tablets in severe impairment.

RENAL IMPAIRMENT
Avoid oral solution due to high propylene glycol content.

MONITORING REQUIREMENTS
Monitor liver function before and during treatment.

PATIENT AND CARER ADVICE
Oral solution tastes bitter.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 21, 25
- Norvir (AbbVie Ltd)
  Ritonavir 100 mg Norvir 100mg tablets | 30 tablet £19.44

Tipranavir

INDICATIONS AND DOSE
HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir
- BY MOUTH USING CAPSULES
  - Child 2-17 years: 500 mg twice daily

CAUTIONS
Cardiac conduction disorders - pancreatitis - structural heart disease

INTERACTIONS → Appendix 1: HIV-protease inhibitors

SIDE-EFFECTS
- Common or very common
  - Acne - anxiety - arthralgia - blood pressure changes - blurred vision - confusion - cough - decreased blood thyroxine concentration - fever - flushing - gastro-intestinal haemorrhage - menorrhagia - mouth ulcers - oedema - peripheral neuropathy - pharyngitis - renal impairment - seizures - syncope
- Uncommon
  - Electrolyte disturbances - myocardial infarction
- Rare
  - Toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
- Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

PREGNANCY
Only use low-dose booster to increase the effect of other protease inhibitors.

HEPATIC IMPAIRMENT
Avoid in decompensated liver disease; in severe impairment without decompensation, use ‘booster’ doses with caution (avoid treatment doses).

DIRECTIONS FOR ADMINISTRATION
Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry.

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer ritonavir oral solution.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 21, 25

Maraviroc

**DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.

**INDICATIONS AND DOSE**

- **CCRS-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals**
  - **BY MOUTH**
  - Child: (consult local protocol)

**SIDE-EFFECTS**

- Rare: Dehydration
- Frequency not known: Anorexia - dyspnoea - influenza-like symptoms - peripheral neuropathy - photosensitivity - renal impairment

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatotoxicity: Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).

**PREGNANCY**

- Manufacturer advises use only if potential benefit outweighs risk—tendency in animal studies.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of oral liquid formulations may include toffee and mint.

**PATIENT AND CARER ADVICE**

- Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

  **Oral solution**

  - CAUTIONARY AND ADVISORY LABELS 5, 21
  - EXCIPIENTS: May contain Vitamin e
  - **Aptivus** (Boehringer Ingelheim Ltd)
    - Tipranavir 100 mg per 1 ml Aptivus 100mg/ml oral solution sugar-free | 95 ml (£129.65)
  - **Capsule**

  - CAUTIONARY AND ADVISORY LABELS 5, 21
  - EXCIPIENTS: May contain Ethanol
  - **Aptivus** (Boehringer Ingelheim Ltd)
    - Tipranavir 250 mg Aptivus 250mg capsules | 120 capsule (£41.00)

**ANTIVIRALS**

**OTHER**

**Maraviroc**

**SIDE-EFFECTS**

- Common or very common: Abdominal pain - anaemia - anorexia - depression - diarrhoea - flatulence - headache - insomnia - malaise - nausea - rash
- Uncommon: Myositis - proteinuria - renal failure - seizures
- Rare: Angina - granulocytopenia - hepatitis - pancytopenia - Stevens-Johnson syndrome - toxic epidermal necrolysis
- Frequency not known: Eosinophilia - fever - hepatic reactions - hypersensitivity reactions - osteonecrosis - rash

**SIDE-EFFECTS, FURTHER INFORMATION**

- Osteonecrosis: For further information see HIV infection p. 391.

**PREGNANCY**

- Manufacturer advises use only if potential benefit outweighs risk—tendency in animal studies.

**HEPATIC IMPAIRMENT**

- Manufacturer advises caution in hepatic impairment, including patients with chronic hepatitis B or C.

**RENAL IMPAIRMENT**

- If estimated glomerular filtration rate less than 80 mL/minute/1.73 m², consult product literature.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  - **Celsentri** (ViiV Healthcare UK Ltd)
    - Maraviroc 150 mg Celsentri 150mg tablets | 60 tablet (£41.27)
    - Maraviroc 300 mg Celsentri 300mg tablets | 60 tablet (£41.27)

**6.5 Influenza**

**Influenza**

**Management**

Oseltamivir p. 408 and zanamivir p. 409 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; oseltamivir is licensed for use within 48 hours of the first symptoms while zanamivir is licensed for use within 36 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in children with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised children.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Information on pandemic influenza, avian influenza, and swine influenza may be found at [www.gov.uk/phe](http://www.gov.uk/phe).

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.
Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Amanitadine hydrochloride is licensed for prophylaxis and treatment of influenza A in children over 10 years of age, but it is no longer recommended.

ANTIVIRALS › NEURAMINIDASE INHIBITORS

Oseltamivir

■ DRUG ACTION Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

■ INDICATIONS AND DOSE

Prevention of influenza

- BY MOUTH
  - Neonate: 3 mg/kg once daily for 10 days for post-exposure prophylaxis.
  
  - Child 1-11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis.
  
  - Child 1-12 years (body-weight 10-15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic.
  
  - Child 1-12 years (body-weight 15-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic.
  
  - Child 1-12 years (body-weight 23-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic.
  
  - Child 12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic.

Treatment of influenza

- BY MOUTH
  - Neonate: 3 mg/kg twice daily for 5 days.
  
  - Child 1-11 months: 3 mg/kg twice daily for 5 days.
  
  - Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days.
  
  - Child 1-12 years (body-weight 15-23 kg): 45 mg twice daily for 5 days.
  
  - Child 1-12 years (body-weight 23-40 kg): 60 mg twice daily for 5 days.
  
  - Child 12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days.
  
  - Child 13-17 years: 75 mg twice daily for 5 days.

■ UNLICENSED USE Not licensed for use in premature infants.

■ SIDE-EFFECTS

- Common or very common Abdominal pain · dyspepsia · headache · nausea · vomiting
- Uncommon Altered consciousness · arrhythmias · convulsions · eczema · rash
- Rare Gastro-intestinal bleeding · hepatitis · neuropsychiatric disorders · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
- Pregnancy Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- Breast feeding Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

- Renal impairment For treatment, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).
  
  For prevention, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²).
  
  Avoid for treatment and prevention if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

■ DIRECTIONS FOR ADMINISTRATION If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

■ PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include tutti-frutti.

■ PATIENT AND CARER ADVICE Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-for-influenza

■ NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158 Oseltamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Oseltamivir is not recommended for seasonal prophylaxis against influenza.

- When influenza is circulating in the community, oseltamivir is a treatment option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients are those who have one or more of the following conditions:

- chronic respiratory disease (including asthma);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.
The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/TA158

Zanamivir

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

- **INDICATIONS AND DOSE**
  - **Post-exposure prophylaxis of influenza**
    - **BY INHALATION OF POWDER**
      - Child 5–17 years: 10 mg once daily for 10 days
  - **Prevention of influenza during an epidemic**
    - **BY INHALATION OF POWDER**
      - Child 5–17 years: 10 mg once daily for up to 28 days
  - **Treatment of influenza**
    - **BY INHALATION OF POWDER**
      - Child 5–17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

- **UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

- **CAUTIONS** Asthma · chronic pulmonary disease · uncontrolled chronic illness

  - **CAUTIONS, FURTHER INFORMATION**
    - Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

- **SIDE-EFFECTS**
  - **Common or very common** Rash
  - **Uncommon** Angioedema · bronchospasm · dysphoena · urticaria
  - **Rare** Neuropsychiatric disorders · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

- **DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

- **PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158

Zanamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Zanamivir is not recommended for seasonal prophylaxis against influenza.

- When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the community.

- May contain Sorbitol

- Contains 8% excipients: could be harmful to patients with sorbitol intolerance

- Children under 5 years old: may have reduced efficacy

- Over 50 years old: may have reduced effectiveness

- For patients over 12 years old, use 5 mg daily

- Do not exceed 10 mg daily

- If resistance to oseltamivir suspected, increase to 10 mg daily

- Tamiflu 45mg capsules | 10 capsule P3 | £15.41
Viral infection

Neonate:

When in epidemic of a new strain of influenza (February 2010) that ‘at risk patients’ also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 36 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, zanamivir may be used for treatment in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients are those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation.

Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see Immunisation against Infectious Disease (2006), available at www.gov.uk/dh.

DRUGS FOR RESPIRATORY DISEASES

MONOCLONAL ANTIBODIES

**Palivizumab**

- **INDICATIONS AND DOSE**

  Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)

  - **BY INTRAMUSCULAR INJECTION**

  - Neonate: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk.

  - Child 1–23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites
Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)

BY INTRAMUSCULAR INJECTION

Child 1-23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

UNLICENSED USE Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

CAUTIONS Moderate to severe acute infection • moderate to severe febrile illness • serum-palivizumab concentration may be reduced after cardiac surgery • thrombocytopenia

SIDE-EFFECTS

Common or very common Fever • injection-site reactions • nervousness

Uncommon Asthenia • constipation • cough • diarrhoea • drowsiness • haemorrhage • hyperkinesia • leucopenia • pain • rash • rhinitis • vomiting • wheeze

Frequency not known Anaphylaxis • apnoea • convulsions • hypersensitivity reactions • thrombocytopenia

ALLERGY AND CROSS-SENSITIVITY Hypersensitivity to humanised monoclonal antibodies.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Synagis (AbbVie Ltd)

Palivizumab 100 mg per 1 ml Synagis 100mg/1ml solution for injection vials | 1 vial £563.64
Synagis 50mg/0.5ml solution for injection vials | 1 vial £306.34

Powder and solvent for solution for injection

Synagis (AbbVie Ltd)

Palivizumab 50 mg Synagis 50mg powder and solvent for solution for injection vials | 1 vial £306.34
Palivizumab 100 mg Synagis 100mg powder and solvent for solution for injection vials | 1 vial £563.64
Desmopressin is an analogue of vasopressin. It is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally.

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand’s disease; it is also used to test fibrinolytic response. Desmopressin also has a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, before introducing more definitive treatment. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, and octreotide are used similarly but experience in children is limited.

### 1.1 Diabetes insipidus

**Other drugs used for Diabetes insipidus** Chlorothiazide, p. 108

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES**

**Desmopressin**

**INDICATIONS AND DOSE**

**Diabetes insipidus, treatment**

- **BY MOUTH**
  - **Neonate:** Initially 1–4 micrograms 2–3 times a day, adjusted according to response.
  - **Child 1-23 months:** Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
  - **Child 2-11 years:** Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
  - **Child 12-17 years:** Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
**Neonate:** Initially 100–500 nanograms, adjusted according to response; usual dose 1.25–10 micrograms daily in 1–2 divided doses.

**Child 1-23 months:** Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response

**Child 12-17 years:** Initially 10–20 micrograms 1–2 times a day, adjusted according to response

**BY INTRAMUSCULAR INJECTION**

**Neonate:** Initially 100 nanograms once daily, adjusted according to response.

**BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**

**Child 1 month-11 years:** Initially 400 nanograms once daily, adjusted according to response

**Child 12-17 years:** Initially 1–4 micrograms once daily, adjusted according to response

**Primary nocturnal enuresis**

**BY MOUTH**

**Child 5-7 years:** 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration

**BY SUBLINGUAL ADMINISTRATION**

**Child 5-7 years:** 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

**Diabetes insipidus, diagnosis (water deprivation test)**

**BY INTRANASAL ADMINISTRATION**

**Child 1-23 months:** 5–10 micrograms for 1 dose, manage fluid input carefully to avoid hypotraemia, not usually recommended

**Child 2-11 years:** 10–20 micrograms for 1 dose, manage fluid input carefully to avoid hypotraemia

**Child 12-17 years:** 20 micrograms for 1 dose, manage fluid input carefully to avoid hypotraemia

**BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**

**Neonate:** Not recommended, use trial of treatment.

**Renal function testing**

**BY INTRANASAL ADMINISTRATION**

**Child 1-11 months:** 10 micrograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload

**Child 1-14 years:** 20 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

**BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**

**Child 1-11 months:** 400 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

**Child 1-17 years:** 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

**Mild to moderate haemophilia and von Willebrand’s disease**

**BY INTRANASAL ADMINISTRATION**

**Child 1-17 years:** 4 micrograms/kg for 1 dose, for pre-operative use give 2 hours before procedure

**BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**

**Child:** 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

**Fibrinolytic response testing**

**BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**

**Child 2-17 years:** 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

**Assessment of antidiuretic hormone secretion (congenital deficiency suspected) (specialist use only)**

**BY INTRANASAL ADMINISTRATION**

**Child 1-23 months:** Initially 100–500 nanograms for 1 dose

**Assessment of antidiuretic hormone secretion (congenital deficiency not suspected) (specialist use only)**

**BY INTRANASAL ADMINISTRATION**

**Child 1-23 months:** 1–5 micrograms for 1 dose

**Diabetes insipidus 413**

**Endocrine system**

**UNLICENSED USE** Consult product literature for individual preparations. Not licensed for assessment of antidiuretic hormone secretion. Oral use of DDAVP intravenous injection is not licensed.

**CONTRA-INDICATIONS** Cardiac insufficiency · conditions treated with diuretics · history of hypotraemia · polydipsia in alcohol dependence · psychogenic polydipsia

**CAUTIONS**

**GENERAL CAUTIONS**

Asthma · avoid fluid overload · cardiovascular disease (not indicated for nocturnal enuresis or nocturia) · conditions which might be aggravated by water retention · cystic fibrosis · epilepsy · heart failure · hypertension (not indicated for nocturnal enuresis or nocturia) · migraine · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

**SPECIFIC CAUTIONS**

Should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

**INTERACTIONS** Appendix 1: desmopressin

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**Common or very common** Hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake · nausea

**Frequency not known** Allergic reactions · emotional disturbance in children · epistaxis · fluid retention · headache · nasal congestion · stomach pain · vomiting

**SPECIFIC SIDE-EFFECTS**

With intranasal use Rhinitis
SIDE-EFFECTS, FURTHER INFORMATION

- **Hyponatraemic convulsions** The risk of hyponatraemic convulsions can be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants).
- **PREGNANCY** Small otopic effect in third trimester; increased risk of pre-eclampsia.
- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.
- **MONITORING REQUIREMENTS** In nocturia, periodic blood pressure and weight checks are needed to monitor for fluid overload.

**DIRECTIONS FOR ADMINISTRATION** DDVAP® and Desmotabs® tablets may be crushed. DDVAP® intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL. DDVAP® injection may be administered orally. Desmopressin oral lyophilisates are for sublingual administration.

- With intravenous use Higher doses of DDVAP® by intravenous infusion, used in mild to moderate haemophilia and von Willebrand’s disease, may be diluted with 30–50 mL Sodium Chloride 0.9% intravenous infusion. For intravenous infusion (Octim®), dilute with 50 mL of Sodium Chloride 0.9% and give over 20 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.

Children requiring an intranasal dose of less than 10 micrograms should be given DDVAP® intranasal solution.

**PATIENT AND CARER ADVICE**

Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).

Medicines for Children leaflet: Desmopressin for bedwetting

Corticosteroid responsive conditions

**415**

Endocrine System

are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 420 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septica shock. However, low-dose hydrocortisone p. 420 can be used in septic shock that is resistant to volume expansion and catecholamines, and is accompanied by suspected or proven adrenal insufficiency.

The suppressive action of glucocorticoids on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most adults a single dose of dexamethasone p. 419 at night is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing's syndrome.

Betamethasone p. 418 and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema which occurs as a result of malignancy (see Prescribing in palliative care p. 19); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 132. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

In the management of asthma, corticosteroids are preferably used by inhalation but systemic therapy along with bronchodilators is required for the emergency treatment of severe acute asthma.

Betamethasone is used in women at risk of preterm delivery to reduce the incidence of neonatal respiratory distress syndrome [unlicensed use].

Dexamethasone should not be used routinely for the prophylaxis and treatment of chronic lung disease in neonates because of an association with adverse neurological effects.

Corticosteroids may be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis, and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia and thrombocytopenic purpura.

High doses of a corticosteroid (usually prednisolone p. 421) are used in the treatment of glomerular kidney disease, including nephrotic syndrome. The condition frequently recurs; a corticosteroid given in high doses and for prolonged periods may delay relapse but the higher incidence of adverse effects limits the overall benefit. Those who suffer frequent relapses may be treated with prednisolone given in a low dose (daily or on alternate days) for 3–6 months; the dose should be adjusted to minimise effects on growth and development. Other drugs used in the treatment of glomerular kidney disease include levamisole p. 367, cyclophosphamide p. 509, chlorambucil p. 508, and ciclosporin p. 496. Congenital nephrotic syndrome may be resistant to corticosteroids and immunosuppressants; indomethacin p. 628 and an ACE inhibitor such as captopril p. 109 have been used.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa, allergic rhinitis, and aphthous ulcers.

**Side-effects**

Overdose or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

**Mineralocorticoid side effects**

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone acetate, but are significant with hydrocortisone, corticotropin, and tetracosactide p. 452. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone p. 421, prednisolone, and triamcinolone.

**Glucocorticoid side effects**

- diabetes
- osteoporosis
- in addition high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.
- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

**Managing side-effects**

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible local treatment with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to systemic treatment.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no
Corticosteroids, replacement therapy

Overview

The adrenal cortex normally secretes hydrocortisone p. 420 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 420; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In Addison’s disease or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2–3 divided doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In acute adrenocortical insufficiency, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9% p. 561.

In hypopituitarism, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 464 and sex hormones should be given as indicated by the pattern of hormone deficiency.

In congenital adrenal hyperplasia, the pituitary gland increases production of corticotropin to compensate for reduced formation of cortisol; this results in excessive adrenal androgen production. Treatment is aimed at suppressing corticotropin using hydrocortisone. Careful and continual dose titration is required to avoid growth retardation and toxicity; for this reason potent, synthetic glucocorticoids such as dexamethasone are usually reserved for use in adolescents. The dose is adjusted according to clinical response and measurement of adrenal androgens and 17-hydroxyprogesterone. Salt-losing forms of congenital adrenal hyperplasia (where there is a lack of aldosterone production) also require mineralocorticoid replacement and salt supplementation (particularly in early life). The dose of mineralocorticoid is adjusted according to electrolyte concentration and plasma-renin activity.

Glucocorticoid therapy

Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 420 is so high that its anti-inflammatory activity is of no clinical relevance.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

The relatively high mineralocorticoid activity of hydrocortisone p. 420, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 421 has predominantly glucocorticoid activity and is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 418 and dexamethasone p. 419 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion.

Some esters of betamethasone and of beclometasone dipropionate p. 154 (beclometasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 418 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates; avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) - systemic infection (unless specific therapy given)

CONTRA-INDICATIONS, FURTHER INFORMATION

For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **CAUTIONS** Congestive heart failure - diabetes mellitus (including a family history of) - diverticulitis - epilepsy - glaucoma (including a family history of or susceptibility to) - history of steroid myopathy - history of tuberculosis or X-ray changes (frequent monitoring required) - hypertension - hypothyroidism - infection (particularly untreated) - myasthenia gravis - ocular herpes simplex (risk of corneal perforation) - osteoporosis - peptic ulcer - psychiatric reactions - recent intestinal anastomoses - recent myocardial infarction (rupture reported) - severe affective disorders (particularly if history of steroid-induced psychosis) - should not be used long-term - thromboembolic disorders - ulcerative colitis
CAUTIONS, FURTHER INFORMATION
For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
Abdominal distension • acute pancreatitis • aggravation of epilepsy • aggravation of schizophrenia • amenorrhoea • anaphylaxis • bruising • candidiasis • congestive heart failure • corneal thinning • Cushing’s syndrome (with moon face, striae and acne) • dyspepsia • ecchymoses • exacerbation of ophthalmic fungal disease • exacerbation of ophthalmic viral disease • exophthalmos • facial erythema • glaucoma • headache • hiccups • hirsutism • hypercholesterolaemia • hyperglycaemia • hyperhidrosis • hyperlipidaemia • hypersensitivity reactions • impaired healing • increased appetite • increased intra-ocular pressure • increased intracranial pressure with papilloedema (usually after withdrawal) • increased susceptibility to and severity of infection • insomnia • leucocytosis • long bone fractures • malaise • menstrual irregularities • muscle weakness • myocardial rupture following recent myocardial infarction • nausea • negative calcium balance • negative nitrogen balance • oesophageal ulceration • petechiae • posterior subcapsular cataracts • potassium loss • psychological dependence • reactivation of dormant tuberculosis • scleral thinning • skin atrophy • sodium retention • suppression of growth • telangiectasia • tendon rupture • thromboembolism • urticaria • vertebral fractures • vertigo • water retention • weight gain

SPECIFIC SIDE-EFFECTS
With intra-articular use • Flushing • may affect the hyaline cartilage

SIDE-EFFECTS, FURTHER INFORMATION
Side effects can be managed by choice of route and duration of course. For further detail see Corticosteroids, general use p. 414

Adrenal suppression • During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists must know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

• Minor surgery under general anaesthesia—usual oral corticosteroid dose on the morning of surgery or hydrocortisone (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.

• Moderate or major surgery—usual oral corticosteroid dose on the morning of surgery and hydrocortisone intravenously at induction, followed by hydrocortisone 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections. Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

Infections • Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

• Chickenpox • Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella–zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

• Measles • Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

• Psychiatric reactions • Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid–induced psychosis, or who have a personal or family history of psychiatric disorders.

PREGNANCY • The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.

Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

• BREAST FEEDING • The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.

• HEPATIC IMPAIRMENT • The plasma–drug concentration may be increased (particularly on systemic use). Oral and parental use should be undertaken with caution.
corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from the NHS Print online ordering portal www.nhsforms.co.uk

GP practices can obtain supplies through Primary Care Support England. NHS Trusts can order supplies via the online ordering portal.

In Scotland, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dppas@apsgroup.co.uk or by fax on 0131 629 9967.

### Betamethasone

**INDICATIONS AND DOSE**

**Suppression of inflammatory and allergic disorders**

**Congenital adrenal hyperplasia**

- By slow intravenous injection, or by intravenous infusion
- Child 1-11 months: Initially 1 mg, repeated up to 4 times in 24 hours according to response
- Child 1-5 years: Initially 2 mg, repeated up to 4 times in 24 hours according to response
- Child 6-11 years: Initially 4 mg, repeated up to 4 times in 24 hours according to response
- Child 12-17 years: 4–20 mg, repeated up to 4 times in 24 hours according to response

**PREGNANCY** Readily crosses the placenta. Transient effect on fetal movements and heart rate.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Cautionary and advisory labels 10
- Betamethasone (non-proprietary)
- Betamethasone (as Betamethasone sodium phosphate) 4 mg per 1 ml Betamethasone 4mg/1ml solution for injection ampoules £ 13.06-15.68

---

**Deflazacort**

**INDICATIONS AND DOSE**

**Inflammatory and allergic disorders**

- By mouth
- Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
- Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

**Nephrotic syndrome**

- By mouth
- Child: Initially 1.5 mg/kg once daily (max. per dose 120 mg), reduced to the lowest effective dose for maintenance

**INTERACTIONS** → Appendix 1: corticosteroids

**PATIENT AND CARER ADVICE** Patient counselling is advised for deflazacort tablets (steroid card).
Dexamethasone readily crosses the placenta.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**

CAUTIONARY AND ADVISORY LABELS 5, 10
- Calcort (Sanofi) 6 mg Calcort 6mg tablets | 60 tablet | £15.82

---

**DIRECTIONS FOR ADMINISTRATION**

**PREGNANCY**

**INTERACTIONS** ▶ Appendix 1: corticosteroids

**SIDE-EFFECTS** Perineal irrigation may follow intravenous administration of the phosphate ester

**PREGNANCY** Dexamethasone readily crosses the placenta.

**DIRECTIONS FOR ADMINISTRATION** For administration by mouth tablets may be dispersed in water or injection solution given by mouth.

For intravenous infusion dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**
Dexamethasone 3.8 mg / mL Injection has replaced Dexamethasone 4 mg / mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

**PATIENT AND CARER ADVICE**
Patient counselling is advised for dexamethasone tablet, oral solution and injection (steroid card).

Medicines for Children leaflet: Dexamethasone for croup

www.medicinesforchildren.org.uk/dexamethasone-croup

---

**MILD CROUP**

- BY MOUTH
  - Child: 150 micrograms/kg for 1 dose

**SEVERE CROUP (OR MILD CROUP THAT MIGHT CAUSE COMPLICATIONS)**

- INITIALLY BY MOUTH
  - Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

**ADJUNCTIVE TREATMENT OF BACTERIAL MENINGITIS (STARTING BEFORE OR WITH FIRST DOSE OF ANTI-BACTERIAL)**

- BY SLOW INTRAVENOUS INJECTION
  - Child 3 months–17 years: 150 micrograms/kg every 6 hours (max. per dose 10 mg) for 4 days

**LIFE-THREATENING CEREBRAL OEDEMA**

- BY INTRAVENOUS INJECTION
  - Child (body-weight up to 35 kg): Initially 16.7 mg, then 3.3 mg every 3 hours for 3 days, then 3.3 mg every 4 hours for 1 day, then 1.7 mg every 6 hours for 4 days, then reduced in steps of 0.8 mg daily
  - Child (body-weight 35 kg and above): Initially 20.8 mg, then 3.3 mg every 2 hours for 3 days, then 3.3 mg every 4 hours for 1 day, then 3.3 mg every 6 hours for 4 days, then reduced in steps of 1.7 mg daily

---

**UNLICENSED USE**
With intravenous use Consult product literature; not licensed for use in bacterial meningitis.

**INTERACTIONS** ▶ Appendix 1: corticosteroids

**SIDE-EFFECTS** Perineal irritation may follow intravenous administration of the phosphate ester

**PREGNANCY** Dexamethasone readily crosses the placenta.

Hydrocortisone

**INDICATIONS AND DOSE**

**Acute adrenocortical insufficiency (Addisonian crisis)**

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
  - Neonate: Initially 10 mg, then (by continuous intravenous infusion) 100 mg/m² daily, alternatively (by intravenous infusion) 100 mg/m² daily in divided doses, to be given every 6–8 hours; adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose.
  - Child 1 month–11 years: Initially 2–4 mg/kg, then 2–4 mg/kg every 6 hours, adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose.
  - Child 12–17 years: 100 mg every 6–8 hours

**Congenital adrenal hyperplasia**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Neonate: 9–15 mg/m² in 3 divided doses, adjusted according to response.
  - Child: 9–15 mg/m² in 3 divided doses, adjusted according to response.

**Adrenal hypoplasia / Addison’s disease, chronic maintenance or replacement therapy**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Neonate: 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed.

**CONTRA-INDICATIONS**

With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

**CAUTIONS**

With rectal use Systemic absorption may occur

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS**

With intravenous use Phosphate ester associated with pain and paraesthesia (particularly in the perineal region)

With rectal use Local irritation

**DIRECTIONS FOR ADMINISTRATION**

With intravenous use For Intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.

With rectal use Systemic absorption may occur

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS**

With intravenous use Phosphate ester associated with pain and paraesthesia (particularly in the perineal region)

With rectal use Local irritation

**DIRECTIONS FOR ADMINISTRATION**

With intravenous use For Intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.
With oral use For administration by mouth, injection solution may be swallowed [unlicensed use] but consider phosphate content.

**PATIENT AND CARER ADVICE** Patient counselling is advised for hydrocortisone tablets and injections (steroid card).

**LESS SUITABLE FOR PRESCRIBING**
- With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

**EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**
- Hydrocortisone (Non-proprietary) 10 mg Hydrocortisone tablets 10mg 30 tablet pack (£85.11 DT price = £68.67)
- Hydrocortisone 20 mg Hydrocortisone tablets 20mg 30 tablet pack (£147.26 DT price = £99.96)

**Powder for solution for injection**
- Solu-Cortef (Pfizer Ltd) Hydrocortisone (as Hydrocortisone sodium succinate) 100 mg 10 vial pack £9.17

**Powder and solvent for solution for injection**
- Solu-Cortef (Pfizer Ltd) Hydrocortisone (as Hydrocortisone sodium succinate) 100 mg 1 vial powder pack (£1.16 DT price = £1.16)

**Solution for injection**
- Hydrocortisone (as Hydrocortisone sodium succinate) 100 mg 1 ml solution pack (£8.33)
- Hydrocortisone (as Hydrocortisone sodium succinate) 500 mg 5 ml solution pack (£36.45)

**Foam**
- EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol
- Colifoam (Meda Pharmaceuticals Ltd) Hydrocortisone ace tate 100 mg 14 granules pack (£39.33 DT price = £9.33)

**DEPO-MEDRONE®**

**Suppression of inflammatory and allergic disorders**
- **BY DEEP INTRAMUSCULAR INJECTION**
- Child: Seek specialist advice, to be injected into the gluteal muscle

**CAUTIONS** Rapid intravenous administration of large doses associated with cardiovascular collapse

**INTERACTIONS** Appendix 1: corticosteroids

**DIRECTIONS FOR ADMINISTRATION** Intravenous injection given over 30 minutes. For intravenous infusion, may be diluted with sodium chloride intravenous infusion 0.9% or 0.45%, or glucose intravenous infusion 5% or 10%.

**PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- Methylprednisolone (Non-proprietary) Methylprednisolone sodium succinate 500 mg 1 vial pack (£9.60)
- Methylprednisolone (as Methylprednisolone sodium succinate) 1 g 1 vial pack (£17.30)
- Methylprednisolone (as Methylprednisolone sodium succinate) 4 g 1 vial pack (£64.32)
- Methylprednisolone (as Methylprednisolone sodium succinate) 8 g 1 vial pack (£128.66)

**Solution for injection**
- Methylprednisolone (as Methylprednisolone sodium succinate) 100 mg 1 ml injection pack (£1.16 DT price = £1.16)
- Methylprednisolone (as Methylprednisolone sodium succinate) 500 mg 5 ml injection pack (£36.45)

**Foam**
- EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol
- Colifoam (Meda Pharmaceuticals Ltd) Methylprednisolone ace tate 100 mg 14 granules pack (£39.33 DT price = £9.33)

**MEDICINAL SYSTEM**

**Corticosteroid responsive conditions**

**DEPO-MEDRONE®**

**Suppression of inflammatory and allergic disorders**
- **BY DEEP INTRAMUSCULAR INJECTION**
- Child: Seek specialist advice, to be injected into the gluteal muscle

**INTERACTIONS** Appendix 1: corticosteroids

**DIRECTIONS FOR ADMINISTRATION** Intravenous injection given over 30 minutes. For intravenous infusion, may be diluted with sodium chloride intravenous infusion 0.9% or 0.45%, or glucose intravenous infusion 5% or 10%.

**PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

Corticosteroid responsive conditions

**Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)**
- **BY MOUTH**
  - Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

**Mild to moderate acute asthma | Severe or life-threatening acute asthma**
- **BY MOUTH**
  - Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary
  - Child 12–17 years: 40–50 mg daily for at least 5 days

**Autoimmune inflammatory disorders (including juvenile idiopathic arthritis, connective tissue disorders and systemic lupus erythematosus)**
- **BY MOUTH**
  - Child: Initially 1–2 mg/kg once daily, to be reduced after a few days if appropriate; maximum 60 mg per day

**Autoimmune hepatitis**
- **BY MOUTH**
  - Child: Initially 2 mg/kg once daily, to be then reduced to minimum effective dose; maximum 40 mg per day

**Corticosteroid replacement therapy**
- **BY MOUTH**
  - Child 12–17 years: 2–2.5 mg/m² daily in 1–2 divided doses, adjusted according to response

**Infantile spasms**
- **BY MOUTH**
  - Child 1 month–1 year: Initially 10 mg 4 times a day for 14 days; increased to 20 mg 3 times a day for 7 days if seizures not controlled after initial 7 days, reduce dose gradually over 15 days until stopped

**Infantile spasms (dose reduction in patient taking 40 mg daily)**
- **BY MOUTH**
  - Child 1 month–1 year: Reduced in steps of 10 mg every 5 days, then stop

**Infantile spasms (dose reduction in patient taking 60 mg daily)**
- **BY MOUTH**
  - Child 1 month–1 year: Reduced to 40 mg daily for 5 days, then reduced to 20 mg daily for 5 days, then reduced to 10 mg daily for 5 days and then stop

**Idiopathic thrombocytopenic purpura**
- **BY MOUTH**
  - Child 1–9 years: 1–2 mg/kg daily for maximum of 14 days, alternatively 4 mg/kg daily for a maximum of 4 days

**Nephrotic syndrome**
- **BY MOUTH**
  - Child: Initially 60 mg/m² once daily for 4–6 weeks until proteinuria ceases, then reduced to 40 mg/m² once daily on alternate days for 4–6 weeks, then withdraw by reducing dose gradually; maximum 80 mg per day

**Nephrotic syndrome (prevention of relapse)**
- **BY MOUTH**
  - Child: 0.5–1 mg/kg once daily or on alternate days for 3–6 months

**Ulcerative colitis | Crohn’s disease**
- **BY MOUTH**
  - Child 2–17 years: 2 mg/kg once daily (max. per dose 60 mg) until remission occurs, followed by reducing doses

**Pneumocystis pneumonia in moderate to severe infections associated with HIV infection**
- **BY MOUTH**
  - Child: 2 mg/kg daily for 5 days, the dose is then reduced over the next 16 days and then stopped, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards, the corticosteroid should be withdrawn before anti-pneumocystis treatment is complete; maximum 80 mg per day

**Proctitis**
- **BY RECTUM USING RECTAL FOAM**
  - Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

**Rectal complications of Crohn’s disease**
- **BY RECTUM USING SUPPOSITORIES**
  - Child 2–17 years: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

- **UNLICENSED USE** Prednisolone rectal foam not licensed for use in children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS**
  - With rectal use: Bowel perforation - extensive fistulas - intestinal obstruction - recent intestinal anastomoses

- **CAUTIONS**
  - With rectal use: Systemic absorption may occur with rectal preparations
  - With systemic use: Duchenne’s muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

- **INTERACTIONS** → Appendix 1: corticosteroids

- **PREGNANCY** As it crosses the placenta 88% of prednisolone is inactivated.
  - With systemic use: Pregnant women with fluid retention should be monitored closely.

- **BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.
  - With systemic use: Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for prednisolone tablets (steroid card).

- **BNFC 2017–2018**

- **MEdICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Foam**
  - Prednisolone (Non-proprietary)
  - Prednisolone (as Prednisolone sodium metasulfobenzoate) 20 mg per 1 application

- **Gastro-resistant tablet**
  - CAUTIONARY AND ADVISORY LABELS 5, 10, 25

- **Prednisolone (Non-proprietary)**
  - Prednisolone 1 mg Prednisolone 1mg gastro-resistant tablets | 30 tablet £1.60-£1.92 DT price = £1.84
Ketoconazole below may have a direct effect on corticotropic tumour cells in patients with Cushing’s disease. It is used under specialist supervision in children over 12 years for treatment of endogenous Cushing’s syndrome.

### ENZYME INHIBITORS

#### Ketoconazole

**DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17a-hydroxylase, 11-hydroxylase steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotropic tumour cells in patients with Cushing’s disease.

**INDICATIONS AND DOSE**

**Endogenous Cushing’s syndrome (specialist use only)**

- **BY MOUTH**
  - Child 12–17 years: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

- **CONTRA-INDICATIONS**
  - Acquired QTc prolongation • avoid concomitant use of hepatotoxic drugs • congenital QTc prolongation

- **CAUTIONS** Risk of adrenal insufficiency

- **INTERACTIONS** → Appendix 1: antifungals, azoles

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain • adrenal insufficiency • diarrhoea • hepatic enzymes increased • increased appetite • nausea • pruritus • rash • vomiting
  - Uncommon Alopecia • dizziness • headache • malaise • somnolence • thrombocytopenia • urticaria
  - Rare Hepatic failure • hepatitis • jaundice • liver damage
  - Very rare Pyrexia
  - Frequency not known Alcohol intolerance • anorexia • arthralgia • azospermia • dermatitis • dry mouth • dysgeusia • dyspepsia • epistaxis • erectile dysfunction • erythema • flatulence • gynaecomastia • hot flush • increased appetite • insomnia • menstrual disorder • myalgia • nervousness • paraesthesia • peripheral oedema • photophobia • photosensitivity • raised intracranial pressure • reduced testosterone concentrations • tongue discoloration • xeroderma

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatotoxicity Potentially life-threatening hepatotoxicity reported rarely.

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.

- **PREGNANCY**
  - Manufacturer advises avoid—teratogenic in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in breast milk.

- **HEPATIC IMPAIRMENT**
  - Avoid in acute or chronic impairment. Do not initiate treatment if liver enzymes greater than 2 times the normal upper limit.

**MONITORING REQUIREMENTS**

- Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.

- Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose

### 2.1 Cushing’s syndrome and disease

#### Cushing’s Syndrome

**Management**

Most types of Cushing’s syndrome are treated surgically. Metyrapone p. 424 may be useful to control the symptoms of the disease or to prepare the child for surgery. The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.
established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hyperglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.

- **Hepatotoxicity** Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.

**PATIENT AND CARER ADVICE**

Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

**Driving and skilled tasks**

Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **Ketocazole (non-proprietary)**
  - **Ketocazole 200 mg** Ketocazole 200mg tablets | 60 tablet (Po) £480.00

### Metyrapone

**DRUG ACTION**

Metyrapone is a competitive inhibitor of 11β-hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

**INDICATIONS AND DOSE**

Differential diagnosis of ACTH-dependent Cushing’s syndrome (specialist supervision in hospital)

- **BY MOUTH**
  - Child: 15 mg/kg every 4 hours for 6 doses, alternatively 300 mg/m² every 4 hours for 6 doses; usual dose 250–750 mg every 4 hours

Management of Cushing’s syndrome (specialist supervision in hospital)

- **BY MOUTH**
  - Child: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

**CONTRA-INDICATIONS**

Adrenocortical insufficiency

**CAUTIONS**

Avoid in acute porphyrias p. 577 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)

**INTERACTIONS**

- Appendix 1: metyrapone

- **SIDE-EFFECTS**
  - Rare: Abdominal pain · allergic skin reactions · hirsutism · hypoadrenalism
  - Frequency not known: Dizziness · headache · hypotension · nausea · sedation · vomiting

- **PREGNANCY**
  - Avoid (may impair biosynthesis of fetal-placental steroids).

- **BREAST FEEDING**
  - Avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Use with caution in hepatic impairment (delayed response).

- **PATIENT AND CARER ADVICE**

  - Driving and skilled tasks
    - Drowsiness may affect the performance of skilled tasks (e.g. driving).

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS 21**
  - **Metopirone** (HRA Pharma UK Ltd)
  - **Metyrapone 250 mg** Metopirone 250mg capsules | 100 capsule (Po) £363.66

### 3 Diabetes mellitus and hypoglycaemia

#### 3.1 Diabetes mellitus

**Diabetes**

05-Jun-2017

**Description of condition**

Diabetes mellitus is a group of metabolic disorders in which persistent hyperglycaemia is caused by deficient insulin secretion or by resistance to the action of insulin. This leads to the abnormalities of carbohydrate, fat and protein metabolism that are characteristic of diabetes mellitus.

Type 1 diabetes mellitus p. 425 and Type 2 diabetes mellitus p. 428 are the two most common classifications of diabetes. Other common types of diabetes are gestational diabetes (develops during pregnancy and resolves after delivery) and secondary diabetes (may be caused by pancreatic damage, hepatic cirrhosis, or endocrinological disease). Treatment with endocrine, antiviral or antipsychotic drugs may also cause secondary diabetes. In children, conditions such as cystic fibrosis can lead to diabetes; monogenic diabetes (previously known as maturity onset diabetes in the young) can also occur due to a single gene defect.

**Driving**

Information on the requirements for driving vehicles by young people receiving treatment for diabetes is available in the BNF or from the DVLA at [www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive](http://www.gov.uk/guidance/diabetes-mellitus-assessing-fitness-to-drive)

**Alcohol**

Adolescents and their carers should be made aware that alcohol can make the signs of hypoglycaemia less clear, and can cause delayed hypoglycaemia; (note: specialist sources recommend that adult patients with diabetes should drink alcohol only in moderation, and when accompanied by food).

**Oral glucose tolerance tests**

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use of diabetes when severe symptoms of hyperglycaemia are present. In children who have less severe symptoms and blood glucose levels that do
not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. It may be useful for diagnosis of monogenic diabetes or cystic fibrosis related diabetes, and is used to establish the presence of gestational diabetes.

An oral glucose tolerance test involves measuring the blood-glucose concentration after fasting, and then 2 hours after drinking a standard anhydrous glucose drink. Anhydrous glucose may alternatively be given as the appropriate amount of Polycal® or as Rapilase® OGTT oral solution.

**HbA1c measurement**

Glycated haemoglobin (HbA1c) forms when red blood cells are exposed to glucose in the plasma. The HbA1c test reflects average plasma glucose over the previous 2 to 3 months and provides a good indicator of glycaemic control. Unlike the oral glucose tolerance test, an HbA1c test can be performed at any time of the day and does not require any special preparation such as fasting.

HbA1c values are expressed in mmol of glycated haemoglobin per mol of haemoglobin (mmol/mol), a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

The HbA1c test is used for monitoring glycaemic control in both Type 1 diabetes below and Type 2 diabetes p. 428 in children, and for diagnosis of Type 2 diabetes in adults. **EvGr** HbA1c should not be used to diagnose diabetes in children. **EvGr** HbA1c is also a reliable predictor of microvascular and macrovascular complications and mortality. Lower HbA1c is associated with a lower risk of long term vascular complications, and children and their carers should be supported to aim for an individualised HbA1c target (see Type 1 diabetes below and Type 2 diabetes p. 428). **EvGr** HbA1c should usually be measured in children with type 1 diabetes every 3 months; and more frequently in children with type 1 diabetes if blood glucose is poorly controlled. **EvGr**

HbA1c monitoring is invalid in children with disturbed erythrocyte turnover or in children with a lack of, or abnormal haemoglobin (for example, any anaemia, a recent blood transfusion, or an altered red cell lifespan). In these cases, quality-controlled plasma glucose profiles, total glycated haemoglobin estimation (if there is abnormal haemoglobin), or fructosamine estimation can be used.

Laboratory measurement of fructosamine concentration measures the glycated fraction of all plasma proteins over the previous 14 to 21 days but is a less accurate measure of glycaemic control than HbA1c.

---

**Type 1 diabetes**

**Description of condition**

Type 1 diabetes describes an absolute insulin deficiency in which there is little or no endogenous insulin secretory capacity due to destruction of insulin-producing beta-cells in the pancreatic islets of Langerhans. This form of the disease has an auto-immune basis in most cases, and it can occur at any age, but most commonly before adulthood.

Loss of insulin secretion results in hyperglycaemia and other metabolic abnormalities. If poorly managed, the resulting tissue damage has both short-term and long-term adverse effects on health; this can result in retinopathy, nephropathy, premature cardiovascular disease, and peripheral artery disease.

Typical features in children presenting with type 1 diabetes are hyperglycaemia, polyuria, polydipsia, weight loss, and excessive tiredness.

**Aims of treatment**

Treatment is aimed at using insulin regimens to achieve as optimal a level of blood-glucose control as is feasible, while avoiding or reducing the frequency of hypoglycaemic episodes, in order to minimise the risk of long-term microvascular and macrovascular complications. Disability from complications can often be prevented by early detection and active management of the disease (Diabetic complications p. 429).

**EvGr** The target for glycaemic control should be individualised for each child, considering factors such as daily activities, aspirations, likelihood of complications, adherence to treatment, comorbidities, and history of hypoglycaemia. Tighter control of blood-glucose is now recommended for children with type 1 diabetes and treatment should attempt to reach near normal HbA1c and blood-glucose concentration. A target HbA1c concentration of 48 mmol/mol (6.5 %) or lower is recommended in children to minimise the risk of long-term complications. The optimal plasma glucose targets for children are:

- **EvGr** Fasting blood-glucose concentration of 4–7 mmol/litre on waking;
- A blood-glucose concentration of 4–7 mmol/litre before meals at other times of the day;
- A blood-glucose concentration of 5–9 mmol/litre after meals;
- A blood-glucose concentration of at least 5 mmol/litre in young people when driving. **EvGr**

**Overview**

**EvGr** Type 1 diabetes requires insulin replacement, supported when necessary by active management of other associated cardiovascular risk factors such as hypertension. Tight glycaemic control may be achieved by intensive insulin management (multiple daily injections or insulin pump therapy) from diagnosis, accompanied by carbohydrate counting.

The effectiveness of metformin in combination with insulin is not yet known in children, and so should not be used; other oral antidiabetic drugs should not be used in combination with insulin as their use may increase the risk of hypoglycaemia.

Dietary control is important in both type 1 and type 2 diabetes and children (with their families) should be encouraged to develop good knowledge of nutrition and how it affects their diabetes and insulin requirements. Healthy eating, regular exercise, and control of body-weight can reduce cardiovascular risk and help improve glycaemic control.

Children with type 1 diabetes over the age of 6 months should receive immunisation against influenza and
Management of type 1 diabetes with insulin

All children with type 1 diabetes require insulin therapy (see also Insulin p. 427). Treatment should be initiated and managed by clinicians with relevant expertise; there are three basic types of insulin regimen, although each regimen should be individualised.

Children should also be offered carbohydrate-counting training as part of a structured education programme. A

Multiple daily injection basal-bolus insulin regimens

One or more separate daily injections of intermediate-acting insulin or long-acting insulin analogue as the basal insulin; alongside individual bolus injections of short-acting insulin before meals. This regimen offers flexibility to tailor insulin therapy with the carbohydrate load of each meal.

Mixed (biphasic) regimen

One, two, or three insulin injections per day of short-acting insulin mixed with intermediate-acting insulin. The insulin preparations may be mixed by the patient at the time of injection, or a premixed product can be used.

Continuous subcutaneous insulin infusion (insulin pump)

A regular or continuous amount of insulin (usually in the form of a rapid-acting insulin analogue or soluble insulin), delivered by a programmable pump and insulin storage reservoir via a subcutaneous needle or cannula.

Recommended insulin regimens

Children should be offered multiple daily injection basal-bolus regimens initiated at diagnosis, considering personal and family circumstances, and personal preferences. Children and their carers should be encouraged to adjust the insulin dose as appropriate after each blood-glucose measurement, and to inject rapid-acting insulin analogues before eating (rather than after eating); this reduces blood-glucose concentrations after meals and helps to optimise blood-glucose control.

If a multiple daily injection basal-bolus insulin regimen is unsuitable, or the child does not have optimal blood-glucose control, it may be necessary to offer an alternative insulin regimen (either continuous subcutaneous insulin infusion or once-, twice- or three-times daily mixed injections) as well as additional support (such as increased contact with their specialist diabetes team).

Continuous subcutaneous insulin infusion (or insulin pump) therapy may be considered under the care of a specialist team. It should only be offered to children under 12 years who suffer disabling hypoglycaemia, or, who have high HbA1c concentrations (69 mmol/mol [8.5 %] or above) with multiple daily injection therapy (including, if appropriate, the use of long-acting insulin analogues) despite a high level of care. Children under 12 years may be offered insulin pump therapy if a multiple daily injection regimen is impractical or inappropriate, but they should undergo a trial of a multiple dose injection regimen between the ages of 12 and 18 years.

If the chosen regimen is a twice daily injection regimen, the insulin dose should be adjusted according to the general trend in pre-meal, bedtime and occasional night-time blood-glucose concentration. A

Insulin requirements

The dosage of insulin must be determined individually for each child and should be adjusted as necessary according to the results of regular monitoring of blood-glucose concentrations.

Prescribers and patients should be aware that initiation of insulin may be followed by a temporary partial remission phase or ‘honeymoon period’ when lower doses of insulin are required than are subsequently necessary to maintain glycaemic control with an HbA1c concentration of less than 48 mmol/mol (6.5 %). A

Insulin doses should be reviewed after puberty (around 1 year after menarche or after the growth spurt in boys) as insulin resistance falls after puberty, and maintenance of pubertal doses may increase the risk for excessive weight gain. E

Persistent poor glucose control, leading to erratic insulin requirements or episodes of hypoglycaemia, may be due to many factors, including adherence, injection technique, injection site problems, blood-glucose monitoring skills, lifestyle issues (including diet and exercise), psychological issues, and organic causes such as renal disease, thyroid disorders, coeliac disease, Addison’s disease or gastroparesis. A review of the child’s injection sites should be offered at each clinic visit. A

Infection, stress, accidental or surgical trauma, and puberty may all increase the required insulin dose. Insulin requirements may be decreased (and therefore susceptibility to hypoglycaemia increased) by physical activity, intercurrent illness, reduced food intake, and in certain endocrine disorders, such as anterior pituitary or adrenal-cortical insufficiency and hypothyroidism. E

Rapid-acting insulin analogues should be supplied for use during intercurrent illness and episodes of hyperglycaemia. A

Risks of hypoglycaemia with insulin

Hypoglycaemia is an inevitable adverse effect of insulin treatment, and children and their carers should be advised of the warning signs and actions to take (for guidance on management, see Hypoglycaemia p. 443). A

Impaired awareness of hypoglycaemia can occur, when the ability to recognise usual symptoms is lost, or when the symptoms are blunted or no longer present. E

Awareness of hypoglycaemia should be discussed and assessed with the child and their carer approximately every 3 months. E

An increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the child. Impaired awareness of symptoms below 3 mmol/litre is associated with a significantly increased risk of severe hypoglycaemia. Beta-blockers can also blunt hypoglycaemic awareness, by reducing warning signs such as tremor. E

Loss of warning of hypoglycaemia among insulin-treated children can be a serious hazard, especially for adolescents who are drivers, cyclists, or in dangerous occupations. Advice should be given in line with the Driver and Vehicle Licensing Agency (DVLA) guidance (see Driving, under Diabetes p. 424).

To restore the warning signs, episodes of hypoglycaemia must be minimised. Insulin regimens, doses and blood-glucose targets should be reviewed and continuous subcutaneous insulin infusion therapy and real-time continuous glucose monitoring should be considered. A

Children and their carers should receive structured education to ensure they are following the principles of a flexible insulin regimen correctly, with additional education regarding avoiding and treating hypoglycaemia for those who continue to have impaired awareness. A

If recurrent severe episodes of hypoglycaemia continue despite appropriate interventions, the child should be referred to a specialist centre. E

Manufacturers advise any switch between brands or formulation of insulin (including switching from animal to human insulin) should be done under strict supervision; a change in dose may be required.

Hypodermic equipment

Children and their carers should be advised on the safe disposal of lancets, single-use syringes, and needles, and should be provided with suitable disposal containers.
Insulin

Overview

For recommended insulin regimens see Type 1 diabetes p. 425 and Type 2 diabetes p. 428.

Insulin is a polypeptide hormone secreted by pancreatic beta-cells. Insulin increases glucose uptake by adipose tissue and muscles, and suppresses hepatic glucose release. The role of insulin is to lower blood-glucose concentrations in order to prevent hyperglycaemia and its associated microvascular, macrovascular and metabolic complications.

The natural profile of insulin secretion in the body consists of basal insulin (a low and steady secretion of background insulin that controls the glucose continuously released from the liver) and meal-time bolus insulin (secreted in response to glucose absorbed from food and drink).

Sources of insulin

Three types of insulin are available in the UK: human insulin, human insulin analogues, and animal insulin. Animal insulins are extracted and purified from animal sources (bovine or porcine insulin). Although widely used in the past, animal insulins are no longer initiated in people with diabetes but may still be used by some adult patients who cannot, or do not wish to, change to human insulins.

Human insulins are produced by recombinant DNA technology and have the same amino acid sequence as endogenous human insulin. Human insulin analogues are produced in the same way as human insulins, but the insulin is modified to produce a desired kinetic characteristic, such as an extended duration of action or faster absorption and onset of action.

Immunological resistance to insulin is uncommon and true insulin allergy is rare. Human insulin and insulin analogues are less immunogenic than animal insulins.

Administration of insulin

Insulin is inactivated by gastro-intestinal enzymes and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin should be injected into a body area with plenty of subcutaneous fat—usually the abdomen (fastest absorption rate) or outer thighs/buttocks (slower absorption compared with the abdomen or inner thighs). Absorption from a limb site can vary considerably (by as much as 20–40%) day-to-day, particularly in children. Local tissue reactions, changes in insulin sensitivity, injection site, blood flow, depth of injection, and the amount of insulin injected can all affect the rate of absorption. Increased blood flow around the injection site due to exercise can also increase insulin absorption.

Lipohypertrophy can occur due to repeatedly injecting into the same small area, and can cause erratic absorption of insulin, and contribute to poor glycaemic control. Patients should be advised not to use affected areas for further injection until the skin has recovered.

Lipohypertrophy can be minimised by using different injection sites in rotation. Injection sites should be checked for signs of infection, swelling, bruising, and lipohypertrophy before administration.

Insulin preparations

Insulin preparations can be broadly categorised into three groups based on their time-action profiles: short-acting insulins (including soluble insulin and rapid-acting insulins), intermediate-acting insulins and long-acting insulins. The duration of action of each particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Short-acting insulins

Short-acting insulins have a short duration and a relatively rapid onset of action, to replicate the insulin normally produced by the body in response to glucose absorbed from a meal. These are available as soluble insulin (human and, bovine or porcine—both rarely used), and the rapid-acting insulin analogues (insulin aspart p. 437, insulin glulisine p. 438 and insulin lispro p. 438).

Soluble insulin

Soluble insulin is usually given subcutaneously but some preparations can be given intravenously and intramuscularly. For maintenance regimens, it is usual to inject the insulin 15 to 30 minutes before meals, depending on the insulin preparation used.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 1 and 4 hours, and a duration of action of up to 9 hours.

When injected intravenously, soluble insulin has a short half-life of only a few minutes and its onset of action is instantaneous.

Soluble insulin administered intravenously is the most appropriate form of insulin for use in diabetic emergencies e.g. Diabetic ketoacidosis p. 430 and peri-operatively.

Rapid-acting insulin

Insulin aspart, insulin glulisine, and insulin lispro have a faster onset of action (within 15 minutes) and shorter duration of action (approximately 2–5 hours) than soluble insulin, and are usually given by subcutaneous injection.

For maintenance regimens, these insulins should ideally be injected immediately before meals. Rapid-acting insulin, administered before meals, has an advantage over short-acting soluble insulin in terms of improved glucose control, reduction of HbA1c, and reduction in the incidence of severe hypoglycaemia, including nocturnal hypoglycaemia.

The routine use of post-meal injections of rapid-acting insulin should be avoided—when given during or after meals, they are associated with poorer glucose control, an increased risk of high postprandial-glucose concentration, and subsequent hypoglycaemia.

Intermediate-acting insulin

Intermediate-acting insulins (isophane insulin p. 434) have an intermediate duration of action, designed to mimic the effect of endogenous basal insulin. When given by subcutaneous injection, they have an onset of action of approximately 1–2 hours, a maximal effect at 3–12 hours, and a duration of action of 11–24 hours.

Isophane insulin is a suspension of insulin with protamine; it may be given as one or more daily injections alongside separate meal-time short-acting insulin injections, or mixed with a short-acting (soluble or rapid-
Type 2 diabetes

Description of condition
Type 2 diabetes is a chronic metabolic condition characterised by insulin resistance. Insufficient pancreatic insulin production also occurs progressively over time, resulting in hyperglycaemia.

Type 2 diabetes in children is associated with increased body-weight, increased risk of renal complications, hypertension, and dyslipidaemia; therefore it increases cardiovascular risk. It is associated with long-term microvascular and macrovascular complications, together with reduced quality of life and life expectancy.

Type 2 diabetes typically develops later in life but is increasingly diagnosed in children, despite previously being considered a disease of adulthood.

Aims of treatment
Treatment is aimed at minimising the risk of long-term microvascular and macrovascular complications by effective blood-glucose control and maintenance of HbA1c at or below the target value set for each individual child.

Overview
Lifestyle modifications (including weight loss, smoking cessation and regular exercise) can help to reduce hyperglycaemia and reduce cardiovascular risk and should be encouraged where appropriate. Children and their carers should also receive advice from a paediatric dietitian to help optimise body-weight and blood-glucose control.

Lifestyle modifications alone are often unsuccessful at achieving glycaemic control in children, therefore antidiabetic drugs should be offered and initiated alongside lifestyle interventions such as diet and exercise, from the time of diagnosis.

Children with type 2 diabetes should receive immunisation against influenza (over the age of 6 months) and pneumococcal infection—see Vaccines p. 747.

Antidiabetic drugs
In children, type 2 diabetes does not usually occur until adolescence and information on the use of oral antidiabetic drugs in children is limited. For recommended treatment regimens and the place in therapy of each drug, see Treatment of type 2 diabetes.

Metformin hydrochloride p. 430 is the only oral antidiabetic drug licensed for use in children. It has an anti-hyperglycaemic effect, lowering both basal and postprandial blood-glucose concentrations. Metformin hydrochloride does not stimulate insulin secretion and therefore, when used alone, does not cause hypoglycaemia.

The dose of standard-release metformin hydrochloride should be increased gradually to minimise the risk of gastro-intestinal side-effects.

There is little experience of the use of other non-insulin antidiabetic drugs in children, with most evidence extrapolated from adult studies.

Several sulfonylureas (such as gliclazide p. 432, glibenclamide p. 431 and tolbutamide p. 432) are available but experience in children is limited; they are not the recommended choice of treatment in children; therefore treatment should be initiated by a specialist. The sulfonylureas may cause hyperglycaemia which may be more common in children than in adults. Hypoglycaemia is more likely with long-acting sulfonylureas such as glibenclamide, which has been associated with severe, prolonged and sometimes fatal cases—for this reason sulfonylureas are usually avoided in children.

Treatment of type 2 diabetes

A target HbA1c concentration of 48 mmol/mol (6.5 %) or lower is ideal to minimise the risk of long-term complications, however an individualised lowest achievable target should be agreed with each child and their carers taking into account factors such as daily activities, individual life goals, complications, and comorbidities. HbA1c concentrations should be monitored every 3 months.

Note: Consider relaxing the target HbA1c level on a case-by-case basis, with particular consideration for children where tight blood-glucose control is not appropriate or poses a high risk of the consequences of hypoglycaemia.

Standard-release metformin hydrochloride is the first-line choice for initial treatment in children and should be offered from diagnosis, alongside nutrition and lifestyle advice.

If the combination of lifestyle changes and metformin hydrochloride fails to reduce HbA1c to the agreed target within 3 to 4 months of therapy, addition of a long-acting insulin or once–daily human isophane insulin p. 434 should be considered (see also, Insulin p. 427).

Initiation of insulin should be under specialist care.

Metformin hydrochloride should be continued alongside insulin, to improve insulin sensitivity. The combination of metformin hydrochloride and once–daily insulin is usually an effective treatment for maintaining glycaemic control in the majority of children for extended periods of time.

If the combination of basal insulin and metformin does not achieve the HbA1c target (and postprandial hyperglycaemia persists) addition of prandial rapid- or short-acting insulin should be initiated and titrated until the target HbA1c is met.

Weight gain may occur and can be particularly problematic in children with type 2 diabetes when insulin therapy is initiated, unless there is careful attention and adherence to dietary measures.

The importance of diet and exercise should be emphasised.

Useful Resources
Diabetic complications

Cardiovascular disease

Diabetes is a strong risk factor for cardiovascular disease later in life. Other risk factors for cardiovascular disease (smoking, hypertension, obesity and hyperlipidaemia) should be addressed. The use of an ACE inhibitor and of a lipid-regulating drug can be beneficial in children with diabetes and a high cardiovascular disease risk. (ACE inhibitors may also have a role in the management of diabetic nephropathy).

Diabetic nephropathy

Regular review of diabetic children over 12 years of age should include an annual test for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (Microalbumin/2® or Microbumintest®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Microalbuminuria can occur transiently during puberty; if it persists (at least 3 positive tests) treatment with an ACE inhibitor or an angiotensin-II receptor antagonist under specialist guidance should be considered; to minimise the risk of renal deterioration, blood pressure should be carefully controlled.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in children with renal impairment.

See also treatment of hypertension in diabetes.

Neuropathy

Clinical neuropathy is rare in children whose diabetes is well controlled.

Diabetes, pregnancy and breast-feeding

Pregnancy and breast-feeding

During pregnancy, women with pre-existing diabetes can be treated with metformin hydrochloride p. 430 [unlicensed use], either alone or in combination with insulin p. 436. Metformin hydrochloride can be continued, or glibenclamide p. 431 resumed, during breast-feeding for those with pre-existing diabetes. Women with gestational diabetes may be treated, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin hydrochloride [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

Diabetes, surgery and medical illness

Children with diabetes should undergo surgery in centres with facilities and expertise for the care of children with diabetes. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these children. All surgery requiring general anaesthesia in children with type 1 and type 2 diabetes requires hospital admission. 

Note: The following recommendations provide general guidance for the management of diabetes during surgery. Local protocols and guidelines should be referred to where they exist.

Use of insulin during surgery

Elective surgery—minor procedures

Minor procedures (procedures of less than 2 hours requiring either general anaesthesia or heavy sedation) in children who have type 1 or type 2 diabetes should not have a major impact on glycaemic control, and a slight modification of the usual regimen may be all that is necessary—adjustments should be made following local protocol; taking into consideration the type of insulin or antidiabetic drugs the child usually takes, whether fasting is required, the time of day of the operation, and requirement for intravenous fluids and glucose. All children who are usually prescribed insulin require intravenous insulin during surgery, to avoid ketoacidosis.

Elective surgery—major procedures

Major procedures (procedures requiring general anaesthesia for more than 2 hours) in children who have type 1 or type 2 diabetes, should ideally be performed when diabetes is under optimal control. If glycaemic control is poor, the procedure should be delayed if possible; otherwise it is advisable to admit the child well in advance of surgery for stabilisation of glycaemic control.

Blood glucose concentration should be maintained within the usual target range of 5–10 mmol/litre throughout the peri-operative period for all surgical procedures.

Children usually prescribed insulin for type 1 or type 2 diabetes require an intravenous insulin infusion p. 436 during surgery (even if fasting) to avoid ketoacidosis. Detailed local protocols should be consulted. In general, the following steps should be followed:

• On the evening before surgery, the usual insulin regimen should be given as normal; the usual bedtime snack should be given and hourly capillary blood glucose monitoring should be initiated to detect hypoglycaemia or hyperglycaemia before the procedure. Ketones should also be checked if blood glucose is above 14 mmol/litre, and an appropriate dose of short-acting insulin should be administered to restore blood glucose to the target range;

• On the morning of surgery the usual insulin dose should be omitted;

• At least 2 hours before the procedure, a maintenance fluid infusion of sodium chloride 0.45% and glucose 5% (sodium chloride with glucose p. 563) intravenous infusion should be started. A switch to sodium chloride 0.9% infusion p. 561 may be required if sodium concentration falls and there is risk of hyponatraemia. After surgery, potassium chloride p. 575 should be added to the intravenous fluid, according to the child’s body weight and fluid requirements. Electrolytes must be measured frequently throughout, and adjustments to the infusion made as necessary;

• Soluble human insulin 1 unit/mL in sodium chloride 0.5% intravenous infusion should be started with the maintenance fluids at an infusion rate appropriate to the blood glucose concentration, to maintain a concentration between 5 and 10 mmol/litre, adjusted according to hourly blood glucose monitoring;

• If the blood glucose concentration falls below 6 mmol/litre the insulin infusion should not be stopped as this will cause rebound hyperglycaemia; instead the rate should be reduced; however, if blood-glucose concentration drops below 4 mmol/litre the insulin infusion can be stopped temporarily for 10–15 minutes.

After surgery, continue the glucose infusion, and the intravenous insulin infusion or additional short-acting insulin as necessary, until the child can eat and drink normally and their usual treatment regimen can resume. A short-acting insulin can also be given if required to reduce hyperglycaemia.
Emergency surgery

Children with diabetes (type 1 and 2) requiring emergency surgery, should always have their blood glucose, blood or urinary ketone concentration, and serum electrolytes checked before surgery. If ketones are high, blood gases should also be checked. If ketoacidosis is present, recommendations for Diabetic ketoacidosis, below, should be followed immediately, and surgery delayed if possible. If there is no acidosis, intravenous fluids and an insulin infusion should be started and managed as for major elective surgery (above).

Use of antidiabetic drugs during surgery

If elective minor surgical procedures only require a short-fasting period (just one missed meal), it may be possible to adjust antidiabetic drugs to avoid a switch to a variable rate intravenous insulin infusion; normal drug treatment can continue.

Children who usually take sulfonylureas should have their medication stopped on the day of surgery.

Sulfonylureas are associated with hypoglycaemia in the fasted state and therefore should not be recommenced until the child is eating and drinking normally.

Children undergoing minor procedures require hourly blood glucose monitoring and, if blood glucose concentration rises above 10 mmol/litre, should be treated with subcutaneous rapid-acting insulin no more frequently than every 3 hours.

Children undergoing a major surgical procedure expected to last at least 2 hours should be managed on an intravenous insulin infusion following the recommendations for Elective surgery (above).

Insulin is almost always required in medical and surgical emergencies.

Metformin hydrochloride below is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. In children undergoing major surgery lasting more than 2 hours, metformin hydrochloride should be discontinued 24 hours before the procedure. Children having minor surgery lasting less than 2 hours may stop their metformin on the day of surgery. Metformin hydrochloride should not be restarted until at least 48 hours after surgery or after the child is eating again, and only once normal renal function has been established.

The manufacturer advises that metformin should also be omitted if contrast medium is administered during surgery to reduce the risk of contrast-induced nephropathy. It should be stopped prior to, or at the time of the test, and not to be restarted until 48 hours afterwards, and only once normal renal function has been established.

Use of antidiabetic drugs during medical illness

Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during intercurrent illness when the drug is unlikely to control hyperglycaemia (such as coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Diabetic ketoacidosis

Management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis, published by the British Society of Paediatric Endocrinology and Diabetes, (available at www.bsped.org.uk) should be followed. Clinically well children with mild ketoacidosis who are dehydrated up to 5% usually respond to oral rehydration and subcutaneous insulin. For those who do not respond, or are clinically unwell, or are dehydrated by more than 5%, insulin and replacement fluids are best given by intravenous infusion.

- To restore circulating volume for children in shock, give 10 mL/kg sodium chloride 0.9% as a rapid infusion, repeat as necessary up to a maximum of 30 mL/kg.
- Further fluid should be given by intravenous infusion at a rate that replaces deficit and provides maintenance over 48 hours; initially use sodium chloride 0.9%, changing to sodium chloride 0.45% and glucose 5% after 12 hours if response is adequate and plasma–sodium concentration is stable.
- Include potassium chloride in the fluids unless anuria is suspected, adjust according to plasma–potassium concentration.
- Insulin infusion is necessary to switch off ketogenesis and reverse acidosis; it should not be started until at least 1 hour after the start of intravenous rehydration fluids.
- Soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.9% intravenous infusion to a concentration of 1 unit/mL and infused at a rate of 0.1 units/kg/hour.
- Sodium bicarbonate infusion (1.26% or 2.74%) is rarely necessary and is used only in cases of extreme acidosis (blood pH less than 6.9) and shock, since the acid-base disturbance is normally corrected by treatment with insulin.
- Once blood glucose falls to 14 mmol/litre, glucose intravenous infusion 5% or 10% should be added to the fluids.
- The insulin infusion rate can be reduced to no less than 0.05 units/kg/hour when blood-glucose concentration has fallen to 14 mmol/litre and blood pH is greater than 7.3 and a glucose infusion has been started; it is continued until the child is ready to take food by mouth. Subcutaneous insulin can then be started.
- The insulin infusion should not be stopped until 1 hour after starting subcutaneous soluble or long acting insulin, or 10 minutes after starting subcutaneous insulin aspart p. 437, or insulin glulisine p. 438, or insulin lispro p. 438.

Hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma occurs rarely in children. Treatment is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion and slower rehydration may be required.

BLOOD GLUCOSE LOWERING DRUGS

Metformin hydrochloride

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

- **INDICATIONS AND DOSE**

  - **Diabetes mellitus**

  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

    - Child 8–9 years (specialist use only): Initially 200 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day

    - Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day

  - **UNLICENSED USE** Not licensed for use in children under 10 years.

Endocrine system

Diabetes mellitus and hypoglycaemia
**CONTRA-INDICATIONS** Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)

**CAUTIONS** Risk factors for lactic acidosis

**CAUTIONS, FURTHER INFORMATION**
- Risk factors for lactic acidosis: Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.

**INTERACTIONS** → Appendix 1: metformin

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · anorexia · diarrhoea (usually transient) · nausea · taste disturbance · vomiting
- **Rare** Decreased vitamin-B₁₂ absorption · erythema · lactic acidosis (withdraw treatment) · pruritus · urticaria
- **Frequency not known** Hepatitis

**SIDE-EFFECTS, FURTHER INFORMATION**
- Gastro-intestinal effects: Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

**PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

**BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.

**HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.

**RENAL IMPAIRMENT** Manufacturer advises consider dose reduction in moderate impairment. Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 ml/minute/1.73 m².

**MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

**PATIENT AND CARER ADVICE**
- Manufacturer advises that patients and their carers should be informed of the risk of lactic acidosis and told to seek immediate medical attention if symptoms such as dyspnoea, muscle cramps, abdominal pain, hypothermia, or asthma occur.
- Medicines for Children leaflet: Metformin for diabetes www.medicinesforchildren.org.uk/metformin-diabetes

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 21
- Metformin hydrochloride (Non-proprietary)
- Metformin hydrochloride 500 mg Metformin 500mg tablets | 28 tablet (Pom) £1.25 DT price = £0.86 | 84 tablet (Pom) £2.58
- Metformin hydrochloride 850 mg Metformin 850mg tablets | 56 tablet (Pom) £2.48 DT price = £1.23 | 60 tablet (Pom) no price available | 300 tablet (Pom) £6.59
- Glucophage (Merck Serono Ltd) Glucophage 500mg tablets | 84 tablet (Pom) £2.88
- Glucophage (Merck Serono Ltd) Glucophage 850mg tablets | 56 tablet (Pom) £3.20 DT price = £1.23

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS** 21
- Metformin hydrochloride (Non-proprietary)
- Metformin hydrochloride 100 mg per 1 ml Metformin 500mg/5ml oral solution sugar free sugar-free | 100 ml (Pom) £0.51 sugar-free | 150 ml (Pom) £6.00 DT price = £1.57
- Metformin hydrochloride 170 mg per 1 ml Metformin 850mg/5ml oral solution sugar free sugar-free | 150 ml (Pom) £19.95

**Metformin hydrochloride 200 mg per 1 ml Metformin 1g/5ml oral solution sugar free sugar-free | 150 ml (Pom) £23.48–£24.00**

**Powder**
- Metformin hydrochloride (Non-proprietary)
- Metformin hydrochloride 1 gram Metformin 1g oral powder sachets sugar free sugar-free | 30 sachet (Pom) no price available

**BLOOD GLUCOSE LOWERING DRUGS**

**SULfonylureas**

**DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

**CONTRA-INDICATIONS** Presence of ketoacidosis

**CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) · G6PD deficiency

**SIDE-EFFECTS**
- **Uncommon** Hypoglycaemia
- **Rare** Agranulocytosis · aplastic anaemia · blood disorders · cholestatic jaundice · haemolytic anaemia · hepatic failure · hepatitis · leucopenia · pancytopenia · thrombocytopenia
- **Frequency not known** Allergic skin reactions (usually in the first 6–8 weeks of therapy) · constipation · diarrhoea · disturbance in liver function · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · gastro-intestinal disturbances · hypersensitivity reactions (usually in the first 6–8 weeks of therapy) · jaundice (usually in the first 6–8 weeks of therapy) · nausea · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hypoglycaemia: This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

**HEPATIC IMPAIRMENT** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

**RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.

**PATIENT AND CARER ADVICE**
- Driving and skilled tasks: Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

**Glibenclamide**

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

**BY MOUTH**
- Child 12-17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

**Maturity-onset diabetes of the young (specialist use only)**

**BY MOUTH**
- Child 12-17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day
Gliclazide

INDICATIONS AND DOSE
Type 2 diabetes mellitus
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 12–17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

Maturity-onset diabetes of the young (specialist use only)
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 12–17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

UNLICENSED USE
Not licensed for use in children.

CONTRA-INDICATIONS
Avoid where possible in acute porphyrias p. 577

INTERACTIONS
Appendix 1: sulfonylureas

PREGNANCY
The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.

BREAST FEEDING
Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
- Glibenclamide (Non-proprietary)
  - Glibenclamide 2.5 mg Glibenclamide 2.5 mg tablets | 28 tablet POM £11.46 DT price = £8.91
  - Glibenclamide 5 mg Glibenclamide 5 mg tablets | 28 tablet POM £14.72 DT price = £1.39

INSULINS

Tolbutamide

INDICATIONS AND DOSE
Type 2 diabetes mellitus
- BY MOUTH
  - Child 12–17 years (specialist use only): 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

UNLICENSED USE
Not licensed for use in children.

CONTRA-INDICATIONS
Avoid where possible in acute porphyrias p. 577

INTERACTIONS
Appendix 1: sulfonylureas

SIDE-EFFECTS
Headache

PREGNANCY
The use of sulfonylureas in pregnancy generally be avoided because of the risk of neonatal hypoglycaemia.

BREAST FEEDING
The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

RENAI IMPAIRMENT
If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet
- Tolbutamide (Non-proprietary)
  - Tolbutamide 500 mg Tolbutamide 500 mg tablets | 28 tablet POM £34.88 DT price = £6.71 | 112 tablet POM £27.00

HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)
Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

SIDE-EFFECTS
- Common or very common
  - Fat hypertrophy at injection site
  - Local reactions at injection site
  - Transient oedema
- Rare
  - Hypersensitivity reactions
  - Rash
  - Urticaria

Overdose
Overdose causes hypoglycaemia.

PREGNANCY
During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

BREAST FEEDING
During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

HEPATIC IMPAIRMENT
Insulin requirements may be decreased in patients with hepatic impairment.
RENAL IMPAIRMENT Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

MONITORING REQUIREMENTS

- Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- Since blood-glucose concentration varies substantially throughout the day, ‘normoglycaemia’ cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).
- While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

DIRECTIONS FOR ADMINISTRATION Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy. Injection devices (‘pens’), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

PRESCRIBING AND DISPENSING INFORMATION

Units The word ‘unit’ should not be abbreviated. Show container to patient or carer and confirm the expected version is dispensed.

PATIENT AND CARER ADVICE Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

- 3M Security Print and Systems Limited Gorse Street, Chadderton Oldham OL9 9QH
- Tel: 0845 610 1112
- GP practices can obtain supplies through their Local Area Team stores.
- NHS Trusts can order supplies from www.nhsforms.co.uk/ or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk/

Driving and skilled tasks Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

INSULINS INTERMEDIATE-ACTING

Biphasic isophane insulin

(Biphasic Isophane Insulin Injection—intermediate acting)

INDICATIONS AND DOSE

Diabetes mellitus

- By subcutaneous injection
- Child: According to requirements

INTERACTIONS Appendix 1: Insulins

SIDE-EFFECTS Protamine may cause allergic reactions

PRESCRIBING AND DISPENSING INFORMATION A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species. Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- Humulin M3 (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin soluble human) 30 unit per 1 ml
  - Insulin human (as Insulin isophane human) 70 unit per 1 ml
  Humulin M3 100units/ml suspension for injection 3ml cartridges
  5 cartridge (£13.08 DT price = £13.08)
  Humulin M3 100units/ml suspension for injection 10ml vials
  1 vial (£15.68)

- Humulin M3 KwikPen (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin soluble human) 30 unit per 1 ml
  - Insulin human (as Insulin isophane human) 70 unit per 1 ml
  Humulin M3 KwikPen 100units/ml suspension for injection 3ml pre-filled pen
  5 pre-filled disposable injection (£21.70 DT price = £21.70)

- Hypurin Porcine 30/70 Mix (Wockhardt UK Ltd)
  - Insulin porcine (as Insulin soluble porcine) 30 unit per 1 ml
  - Insulin porcine (as Insulin isophane porcine) 70 unit per 1 ml
  Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 3ml cartridges
  5 cartridge (£37.80)
  Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 10ml vials
  1 vial (£25.20)

- Insuman Comb 15 (Sanofi)
  - Insulin human (as Insulin soluble human) 15 unit per 1 ml
  - Insulin human (as Insulin isophane human) 85 unit per 1 ml
  Insuman Comb 100units/ml suspension for injection 3ml cartridges
  5 cartridge (£17.50)

- Insuman Comb 25 (Sanofi)
  - Insulin human (as Insulin soluble human) 25 unit per 1 ml
  - Insulin human (as Insulin isophane human) 75 unit per 1 ml
  Insuman Comb 25 100units/ml suspension for injection 5ml vials
  1 vial (£5.61)
  Insuman Comb 25 100units/ml suspension for injection 3ml cartridges
  5 cartridge (£17.50)

- Insuman Comb 25 SoloStar (Sanofi)
  - Insulin human (as Insulin soluble human) 25 unit per 1 ml
  - Insulin human (as Insulin isophane human) 75 unit per 1 ml
  Insuman Comb 25 100units/ml suspension for injection 3ml pre-filled SoloStar pen
  5 pre-filled disposable injection (£19.80)

- Insuman Comb 50 (Sanofi)
  - Insulin human (as Insulin soluble human) 50 unit per 1 ml
  - Insulin human (as Insulin isophane human) 50 unit per 1 ml
  Insuman Comb 50 100units/ml suspension for injection 3ml cartridges
  5 cartridge (£17.50)
Isophane insulin

(Isophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane Insulin (NPH)—intermediate acting)

- INDICATIONS AND DOSE

Diabetes mellitus
  - BY SUBCUTANEOUS INJECTION
  - Child: According to requirements

- INTERACTIONS ➔ Appendix 1: insulins

- SIDE-EFFECTS Protamine may cause allergic reactions

- PREGNANCY Recommended where longer-acting insulins are needed.

- PRESCRIBING AND DISPENSING INFORMATION A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
  - Humulin I (Eli Lilly and Company Ltd)
    - Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I 100units/ml suspension for injection 10ml vials | 1 vial (Pom) £15.68
    - Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pom) £19.08 DT price = £19.08
  - Humulin I KwikPen (Eli Lilly and Company Ltd)
    - Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (Pom) £21.70 DT price = £21.70
  - Hypurin Bovine Isophane (Wockhardt UK Ltd)
    - Insulin bovine (as Insulin isophane bovine) 100 unit per 1 ml Hypurin Bovine Isophane 100units/ml suspension for injection 10ml vials | 1 vial (Pom) £27.72
    - Hypurin Bovine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pom) £41.58
  - Hypurin Porcine Isophane (Wockhardt UK Ltd)
    - Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml Hypurin Porcine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pom) £37.80
    - Hypurin Porcine Isophane 100units/ml suspension for injection 10ml vials | 1 vial (Pom) £25.20
  - Insulatard (Novo Nordisk Ltd)
    - Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard 100units/ml suspension for injection 10ml vials | 1 vial (Pom) £7.48
  - Insulatard InnoLet (Novo Nordisk Ltd)
    - Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard InnoLet 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (Pom) £20.40 DT price = £21.70
  - Insulatard Penfill (Novo Nordisk Ltd)
    - Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pom) £22.90 DT price = £19.08
  - Insuman Basal (Sanofi)
    - Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 5ml vials | 1 vial (Pom) £5.61
    - Insuman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pom) £17.50 DT price = £19.08
  - Insuman Basal SoloStar (Sanofi)
    - Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection (Pom) £19.80 DT price = £21.70

Biphasic insulin aspart

(Intermediate-acting insulin)

- INDICATIONS AND DOSE

Diabetes mellitus
  - BY SUBCUTANEOUS INJECTION
  - Child: Administer up to 15 minutes before or soon after a meal, according to requirements

- CAUTIONS Children under 12 years (use only if benefit likely compared to soluble insulin)

- INTERACTIONS ➔ Appendix 1: insulins

- SIDE-EFFECTS Protamine may cause allergic reactions

- PRESCRIBING AND DISPENSING INFORMATION Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
  - NovoMix 30 FlexPen (Novo Nordisk Ltd)
    - Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (Pom) £29.89 DT price = £29.89
  - NovoMix 30 Penfill (Novo Nordisk Ltd)
    - Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pom) £28.79

Biphasic insulin lispro

(Intermediate-acting insulin)

- INDICATIONS AND DOSE

Diabetes mellitus
  - BY SUBCUTANEOUS INJECTION
  - Child: Administer up to 10 minutes before or soon after a meal, according to requirements

- INTERACTIONS ➔ Appendix 1: insulins

- SIDE-EFFECTS Protamine may cause allergic reactions

- PRESCRIBING AND DISPENSING INFORMATION Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
  - Humalog Mix25 (Eli Lilly and Company Ltd)
    - Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100units/ml suspension for injection 10ml vials | 1 vial (Pom) £16.61
    - Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pom) £29.46 DT price = £29.46
  - Humalog Mix 25 KwikPen (Eli Lilly and Company Ltd)
    - Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (Pom) £30.98 DT price = £30.98
Evidence of the safety of long-acting insulin

**INSULINS > LONG-ACTING**

**Insulin degludec**
(Recombinant human insulin analogue—long acting)

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
  - **By subcutaneous injection**
  - Child 1-17 years: Dose to be given according to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Insulin degludec (Tresiba®) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - All Wales Medicines Strategy Group (AWMSG) Decisions
    - The All Wales Medicines Strategy Group has advised (October 2015) that insulin degludec (Tresiba®) is not recommended for use within NHS Wales for the treatment of diabetes mellitus in adolescents and children from the age of 1 year.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Solution for injection**
      - **Tresiba FlexTouch** (Novo Nordisk Ltd)
      - **Insulin human (as Insulin degludec) 100 unit per 1 ml** Tresiba FlexTouch 100units/ml solution for injection 1ml pre-filled pen | 3 pre-filled disposable injection £46.60
      - **Insulin human (as Insulin degludec) 200 unit per 1 ml** Tresiba FlexTouch 200units/ml solution for injection 2ml pre-filled pen | 3 pre-filled disposable injection £55.92
      - **Tresiba Penfill** (Novo Nordisk Ltd)
      - **Insulin human (as Insulin degludec) 100 unit per 1 ml** Tresiba Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge £46.60

- **Insulin glargine**
(Recombinant human insulin analogue—long acting)

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
  - **By subcutaneous injection**
  - Child 2-17 years: According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Scottish Medicines Consortium (SMC) Decisions
    - The Scottish Medicines Consortium has advised that Lantus® preparations (April 2013) and Toujeo® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:
      - In those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
      - As a once daily insulin therapy for patients who require a carer to administer their insulin
    - It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Solution for injection**
      - **Abasaglar** (Eli Lilly and Company Ltd)
      - **Insulin human (as Insulin glargine) 100 unit per 1 ml** Abasaglar 100units/ml solution for injection 3ml cartridges | 5 cartridge £35.28 DT price = £41.50
      - **Abasaglar KwikPen** (Eli Lilly and Company Ltd)
      - **Insulin human (as Insulin glargine) 100 unit per 1 ml** Abasaglar KwikPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £35.28 DT price = £41.50
      - **Lantus** (Sanofi)
      - **Insulin human (as Insulin glargine) 100 unit per 1 ml** Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge £41.50 DT price = £41.50
      - Lantus 100units/ml solution for injection 10ml vials | 1 vial £30.68
# Insulin zinc suspension

**Insulin zinc suspension (mixed)—long acting**

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - **BY SUBCUTANEOUS INJECTION**
    - **Child:** According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulins are needed; insulin detemir p. 435 may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Suspension for injection**
    - Hypurin Bovine Lente (Wockhardt UK Ltd)
      - Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml Hypurin Bovine Lente 100 units/ml suspension for injection 10 ml vials | 1 vial (PBN) £27.72

---

# Protamine zinc insulin

**Protamine zinc insulin injection—long acting**

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - **BY SUBCUTANEOUS INJECTION**
    - **Child:** According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **SIDE-EFFECTS** Protamine may cause allergic reactions
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulins are needed; insulin detemir p. 435 may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Suspension for injection**
    - Hypurin Bovine Protamine Zinc (Wockhardt UK Ltd)
      - Insulin bovine (as Insulin protamine zinc bovine) 100 unit per 1 ml Hypurin Bovine Protamine Zinc 100 units/ml suspension for injection 10 ml vials | 1 vial (PBN) £27.72

---

# Insulin

**Insulin (Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)**

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - **BY SUBCUTANEOUS INJECTION**
    - **Child:** According to requirements
  - **Hyperglycaemia during Illness**
    - **BY INTRAVENOUS INFUSION**
    - **Neonate:** 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.
    - **Child:** 0.025–0.1 unit/kg/hour, dose to be adjusted according to blood-glucose concentration
  - **Neonatal hyperglycaemia | Neonatal diabetes**
    - **BY INTRAVENOUS INFUSION**
    - **Neonate:** 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

- **Diabetic ketoacidosis | Diabetes during surgery**
  - **BY INTRAVENOUS INFUSION**
  - **Child:** (consult local protocol)

- **INTERACTIONS** → Appendix 1: insulins
- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.
  - With intravenous use For **intravenous infusion,** dilute to a concentration of 1 unit/mL with Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin. For **intravenous infusion in neonatal intensive care,** dilute 5 units to a final volume of 50 mL with Sodium Chloride 0.9% and mix thoroughly; an intravenous infusion rate of 0.1 mL/kg/hour provides a dose of 0.01 units/kg/hour.

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.
- **NATIONAL FUNDING/ACCESS DECISIONS**

---

*BNFC 2017–2018*
are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**

- **Actrapid** (Novo Nordisk Ltd)
  - Insulin human (as Insulin soluble human) 100 unit per
  - 1 ml Actrapid 100units/ml solution for injection 10ml vials | 1 vial £74.78

- **Humulin S** (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin soluble human) 100 unit per
  - 1 ml Humulin S 100units/ml solution for injection 10ml vials | 1 vial £15.68

- **Humulin 5** (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin soluble human) 100 unit per
  - 1 ml Humulin 5 100units/ml solution for injection 3ml cartridges | 5 cartridge £19.08

- **Hypurin Bovine Neutral** (Wockhardt UK Ltd)
  - Insulin bovine (as Insulin soluble bovine) 100 unit per
  - 1 ml Hypurin Bovine Neutral 100units/ml solution for injection 10ml vials | 1 vial £27.72

- **Hypurin Bovine Neutral** (Wockhardt UK Ltd)
  - Insulin bovine (as Insulin soluble bovine) 100 unit per
  - 1 ml Hypurin Bovine Neutral 100units/ml solution for injection 3ml cartridges | 5 cartridge £41.58

- **Hypurin Porcine Neutral** (Wockhardt UK Ltd)
  - Insulin porcine (as Insulin soluble porcine) 100 unit per
  - 1 ml Hypurin Porcine Neutral 100units/ml solution for injection 10ml vials | 1 vial £25.20

- **Insuman Infusat** (Sanofi)
  - Insulin human 100 unit per 1 ml Insuman Infusat 100units/ml solution for injection 3.15ml cartridges | 5 cartridge £250.00

- **Insuman Rapid** (Sanofi)
  - Insulin human (as Insulin soluble human) 100 unit per
  - 1 ml Insuman Rapid 100units/ml solution for injection 3ml cartridges | 5 cartridge £17.50

**Insulin aspart**

(Recombinant human insulin analogue—short acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**

- **BY SUBCUTANEOUS INJECTION**
  - Child 1 month–1 year: Administer immediately before meals or when necessary shortly after meals, according to requirements
  - Child 2–17 years: Administer immediately before meals or when necessary shortly after meals, according to requirements

- **BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child 1 month–1 year: According to requirements
  - Child 2–17 years: According to requirements

**UNLICENSED USE**

Not licensed for use in children under 2 years.

**INTERACTIONS**

- Appendix 1: insulins

**PREGNANCY**

Not known to be harmful—may be used during pregnancy.

**BREAST FEEDING**

Not known to be harmful—may be used during lactation.

**DIRECTIONS FOR ADMINISTRATION**

Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

**With intravenous use**

For intravenous infusion, dilute to a concentration of 0.05–1 unit/ml with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 ml of infusion fluid containing insulin.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus** (type 1) (July 2008) NICE TA151

  Continuous subcutaneous insulin infusion is recommended as an option in children over 12 years with type 1 diabetes:

  - who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
  - whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

  Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

  www.nice.org.uk/TA151

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Fiasp** (Novo Nordisk Ltd)
  - Insulin aspart 100 unit per 1 ml Fiasp 100units/ml solution for injection 10ml vials | 1 vial £14.08 DT price = £14.08

- **Fiasp FlexTouch** (Novo Nordisk Ltd)
  - Insulin aspart 100 unit per 1 ml Fiasp FlexTouch 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £30.60 DT price = £30.60

- **Fiasp Penfill** (Novo Nordisk Ltd)
  - Insulin aspart 100 unit per 1 ml Fiasp Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge £28.31 DT price = £28.31

- **NovoRapid** (Novo Nordisk Ltd)
  - Insulin aspart 100 unit per 1 ml NovoRapid 100units/ml solution for injection 3ml pre-filled pen | 1 vial £15.68 DT price = £14.08

- **NovoRapid FlexPen** (Novo Nordisk Ltd)
  - Insulin aspart 100 unit per 1 ml NovoRapid FlexPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £30.60 DT price = £30.60

- **NovoRapid FlexTouch** (Novo Nordisk Ltd)
  - Insulin aspart 100 unit per 1 ml NovoRapid FlexTouch 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £30.60 DT price = £30.60

- **NovoRapid Penfill** (Novo Nordisk Ltd)
  - Insulin aspart 100 unit per 1 ml NovoRapid Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge £28.31 DT price = £28.31

- **NovoRapid PumpCart** (Novo Nordisk Ltd)
  - Insulin aspart 100 unit per 1 ml NovoRapid PumpCart 100units/ml solution for injection 1.6ml cartridges | 5 cartridge £15.10

- **Diabetes mellitus** 437
Insulin glulisine
(Recombinant human insulin analogue—short acting)

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - **BY SUBCUTANEOUS INJECTION**
      - Child: Administer immediately before meals or when necessary shortly after meals, according to requirements
    - **BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION**
      - Child: According to requirements
  - **UNLICENSED USE** Not licensed for children under 6 years.
  - **INTERACTIONS** → Appendix 1: insulins
  - **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - **NICE technology appraisals (TAs)**
      - Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151
        - Continuous subcutaneous insulin infusion is recommended as an option in children over 12 years with type 1 diabetes:
          - who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycemic control with multiple-injection regimens, or
          - whose glycaemic control remains inadequate (HbA\(_1c\) over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
        - Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.
      - www.nice.org.uk/TA151
    - **Scottish Medicines Consortium (SMC) Decisions**
      - The Scottish Medicines Consortium has advised (October 2008) that Apidra® is accepted for restricted use within NHS Scotland for the treatment of children over 6 years with diabetes mellitus in whom the use of a short-acting insulin analogue is appropriate.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - Apidra (Sanofi)
      - Insulin glulisine 100 unit per 1 ml
        - Apidra 100units/ml solution for injection 10ml vials | 1 vial £16.00
        - Apidra 100units/ml solution for injection 3ml cartridges | 5 cartridge pack £28.30
    - Apidra SoloStar (Sanofi)
      - Insulin glulisine 100 unit per 1 ml
        - Apidra 100units/ml solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection pack £28.30 DT price = £28.30

Insulin lispro
(Recombinant human insulin analogue—short acting)

- **INDICATIONS AND DOSE**
  - **Diabetes mellitus**
    - **BY SUBCUTANEOUS INJECTION**
      - Child 1 month-1 year: Administer shortly before meals or when necessary shortly after meals, according to requirements
      - Child 2-17 years: Administer shortly before meals or when necessary shortly after meals, according to requirements
    - **BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
      - Child 1 month-1 year: According to requirements
      - Child 2-17 years: According to requirements
  - **UNLICENSED USE** Not licensed for use in children under 2 years.
  - **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)
  - **INTERACTIONS** → Appendix 1: insulins
  - **PREGNANCY** Not known to be harmful—may be used during pregnancy.
  - **BREAST FEEDING** Not known to be harmful—may be used during lactation.
  - **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.
    - With intravenous use For intravenous infusion, dilute to a concentration of 0.1–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - **NICE technology appraisals (TAs)**
      - Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151
        - Continuous subcutaneous insulin infusion is recommended as an option in children over 12 years with type 1 diabetes:
          - who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycemic control with multiple-injection regimens, or
          - whose glycaemic control remains inadequate (HbA\(_1c\) over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
        - Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

        - Apidra 100units/ml solution for injection 3ml cartridges | 5 cartridge pack £28.30
3.1a Diabetes, diagnosis and monitoring

Diabetes mellitus, diagnostic and monitoring devices

Urinalysis
Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with Microl-Test II® but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood monitoring
Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia.

Carers and children should be properly trained in the use of blood glucose monitoring systems and the appropriate action to take on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Children using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the blood glucose level is high or if the child is unwell, blood ketones should be measured according to local guidelines in order to detect diabetic ketoacidosis. Children and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Other drugs used for Diabetes, diagnosis and monitoring
Glucose, p. 564

Blood monitoring test strips

Blood glucose testing strips

Accu-Chek Inform II testing strips (Roche Diagnostics Ltd)
50 strip • No NHS indicative price available • Drug Tariff (Part IXr)

Active testing strips (Roche Diabetes Care Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

Advocate Redi-Code+ testing strips (Diabetes Care Technology Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

AutoSense testing strips (Advance Diagnostic Products (NI) Ltd)
25 strip • NHS indicative price = £4.50 • Drug Tariff (Part IXr)

Aviva testing strips (Roche Diabetes Care Ltd)
50 strip • NHS indicative price = £15.96 • Drug Tariff (Part IXr)

BGStar testing strips (Sanofi)
50 strip • NHS indicative price = £14.73 • Drug Tariff (Part IXr)

Betachek C50 cassette (National Diagnostic Products)
100 device • NHS indicative price = £29.98 • Drug Tariff (Part IXr)

Betachek GS testing strips (National Diagnostic Products)
50 strip • £14.19 • Drug Tariff (Part IXr)

Betachek Visual testing strips (National Diagnostic Products)
50 strip • NHS indicative price = £6.80 • Drug Tariff (Part IXr)

Breeze 2 testing discs (Bayer Pte)
50 strip • NHS indicative price = £15.00 • Drug Tariff (Part IXr)

CareSens N testing strips (Spirit Healthcare Ltd)
50 strip • NHS indicative price = £12.75 • Drug Tariff (Part IXr)

CareSens PRO testing strips (Spirit Healthcare Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

Compact testing strips (Roche Diabetes Care Ltd)
51 strip • NHS indicative price = £16.39 • Drug Tariff (Part IXr)

Contour Next testing strips (Bayer Diagnostics Manufacturing Ltd)
50 strip • NHS indicative price = £15.04 • Drug Tariff (Part IXr)

Contour TS testing strips (Bayer Diagnostics Manufacturing Ltd)
50 strip • NHS indicative price = £9.50 • Drug Tariff (Part IXr)

Contour testing strips (Bayer Diagnostics Manufacturing Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

Dario Lite testing strips (LabStyle Innovations Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

Dario testing strips (LabStyle Innovations Ltd)
50 strip • NHS indicative price = £14.95 • Drug Tariff (Part IXr)

Diastix testing strips (Bayer Diagnostics Manufacturing Ltd)
50 strip • NHS indicative price = £2.89 • Drug Tariff (Part IXr)

Element testing strips (Neon Diagnostics Ltd)
50 strip • NHS indicative price = £9.89 • Drug Tariff (Part IXr)

Finetest Lite testing strips (Neon Diagnostics Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

FreeStyle Lite testing strips (Abbott Laboratories Ltd)
50 strip • NHS indicative price = £15.97 • Drug Tariff (Part IXr)

FreeStyle Optium testing strips (Abbott Laboratories Ltd)
50 strip • NHS indicative price = £15.87 • Drug Tariff (Part IXr)

FreeStyle testing strips (Abbott Laboratories Ltd)
50 strip • NHS indicative price = £15.97 • Drug Tariff (Part IXr)

GlucuNEO testing strips (Neon Diagnostics Ltd)
50 strip • NHS indicative price = £9.89 • Drug Tariff (Part IXr)

Glucodock testing strips (Medisana Healthcare (UK) Ltd)
50 strip • NHS indicative price = £14.90 • Drug Tariff (Part IXr)

Glucolab testing strips (Neon Diagnostics Ltd)
50 strip • NHS indicative price = £9.89 • Drug Tariff (Part IXr)

Glucomen GM testing strips (A Menarini Diagnostics Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

Glucomen LX Sensor testing strips (A Menarini Diagnostics Ltd)
50 strip • NHS indicative price = £15.76 • Drug Tariff (Part IXr)

Glucomen Sensor testing strips (A Menarini Diagnostics Ltd)
50 strip • NHS indicative price = £14.83 • Drug Tariff (Part IXr)

Glucomen Visio testing strips (A Menarini Diagnostics Ltd)
50 strip • NHS indicative price = £15.75 • Drug Tariff (Part IXr)

Glucomen areo Sensor testing strips (A Menarini Diagnostics Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

Glucovuvi testing strips (National Diagnostic Products)
50 strip • NHS indicative price = £8.95 • Drug Tariff (Part IXr)

Glucorx GO testing strips (Glucorx Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

Glucorx HCT Glucose testing strips (Glucorx Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

Glucorx Nexus testing strips (Glucorx Ltd)
50 strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

Glucorx Q testing strips (Glucorx Ltd)
50 strip • NHS indicative price = £5.45 • Drug Tariff (Part IXr)

**BLOOD KETONES TESTING STRIPS**

FreeStyle Optium beta-ketone testing strips (Abbott Laboratories Ltd) | 10 strip • NHS indicative price = £21.36 • Drug Tariff (Part IXr)
GlucoMen LX beta-ketone testing strips (A Menarini Diagnostics Ltd) | 10 strip • NHS indicative price = £21.06 • Drug Tariff (Part IXr)
GlucoMen areo Ketone Sensor testing strips (A Menarini Diagnostics Ltd) | 10 strip • NHS indicative price = £22.95 • Drug Tariff (Part IXr)

**HYPODERMIC INSULIN INJECTION PENS**

ClikSTAR hypodermic insulin injection pens reusable for 3ml (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).

Autopen 24 hypodermic insulin injection pen reusable for 3ml cartridge 1 unit dial up / range 1-21 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.58 • Drug Tariff (Part IXa)

Autopen 24 hypodermic insulin injection pen reusable for 3ml cartridge 2 unit dial up / range 2-42 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.58 • Drug Tariff (Part IXa)

**AUTOPEM CLASSIC**

Autopen® Classic (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).

Autopen Classic hypodermic insulin injection pen reusable for 3ml cartridge 1 unit dial up / range 1-21 units (Owen Mumford Ltd) 1 device • NHS indicative price = £16.84 • Drug Tariff (Part IXa)

**Urine analysis reagent strips**

**PRESCRIBING AND DISPENSING INFORMATION**

Other reagent strips available for urinalysis
Include: Combur-3 Test® (glucose and protein—Roche Diagnostics); Clinitek Microalbumin® (albumin and creatinine—Siemens); Ketodastix® (glucose and ketones—Bayer Diagnostics); Medit-Test Combi 2® (glucose and protein—BHR); Micral-Test II®, used to detect microalbuminuria but this should be followed by confirmation in the laboratory—false positive results are common (albumin—Roche Diagnostics); Microalbumastix® (albumin and creatinine—Siemens); Uristix® (glucose and protein—Siemens).

These reagent strips are not prescribable under National Health Service (NHS).

**Urine glucose testing strips**

Diastix testing strips (Bayer Diagnostics Manufacturing Ltd) 50 strip • NHS indicative price = £2.89 • Drug Tariff (Part IXa)

Medi-Test Glucose testing strips (BHR Pharmaceuticals Ltd) 50 strip • NHS indicative price = £2.33 • Drug Tariff (Part IXa)

Mission Glucose testing strips (Spirit Healthcare Ltd) 50 strip • NHS indicative price = £2.29 • Drug Tariff (Part IXa)

**Urine protein testing strips**

Albustix testing strips (Siemens Medical Solutions Diagnostics Ltd) 50 strip • NHS indicative price = £4.10 • Drug Tariff (Part IXa)

Medi-Test Protein 2 testing strips (BHR Pharmaceuticals Ltd) 50 strip • NHS indicative price = £3.27 • Drug Tariff (Part IXa)

**Urine ketones testing strips**

GlucoRx KetoRx Sticks 2GK testing strips (GlucoRx Ltd) 50 strip • NHS indicative price = £2.25 • Drug Tariff (Part IXa)

Ketostix testing strips (Bayer Diagnostics Manufacturing Ltd) 50 strip • NHS indicative price = £3.06 • Drug Tariff (Part IXa)

Mission Ketone testing strips (Spirit Healthcare Ltd) 50 strip • NHS indicative price = £2.50 • Drug Tariff (Part IXa)

**Needle free Insulin delivery systems**

INSULET®

For use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max. 40 units. Available as starter set (Insulet® device, nozzle cap, nozzle and piston, 1 × 10-mL adaptor, 1 × 3-mL adaptor, 1 cartridge cap removal key), nozzle pack (15 nozzles), cartridge adaptor pack (15 adaptors), or vial adaptor pack (15 adaptors).

Insulet starter set (Spirit Healthcare Ltd) 1 pack • NHS indicative price = £90.00 • Drug Tariff (Part IXa)

**Hypoglycaemia**

**3.2 Hypoglycaemia**

**Treatment of hypoglycaemia**

Prompt treatment of hypoglycaemia in children from any cause is essential as severe hypoglycaemia may cause subsequent neurological damage. Hyperinsulinism, fatty acid oxidation disorders and glycogen storage disease are less common causes of acute hypoglycaemia in children.

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. If necessary this may be repeated after 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal (if it is due) can prevent blood-glucose concentration from falling again.
Proprietary products of quick-acting carbohydrate (e.g. GlucoGel®, DextroGel®, GSF-Syrup®, Rapilose® gel) are available on prescription for patients to keep on hand in case of hypoglycaemia. Alternatively, approximately 10 g of glucose is available from 2 teaspoons of sugar, or from 3 sugar lumps, and also from non-diet versions of the following soft drinks: 110 mL of Lucozade® Energy Original (also, see note below), 100 mL of Coca-Cola®, 19 mL of Ribena® Blackcurrant (to be diluted).

Note: the carbohydrate content of commercially available glucose-containing drinks is currently subject to change—individual product labels should be checked. Patients should be aware that for a time, both old and new bottles and cans may be available—individual product labels should be checked.

Hypoglycaemia which causes unconsciousness or seizures is an emergency. Glucagon below, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases blood-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon can be issued to parents or carers of insulin-treated children for emergency use in hypoglycaemic attacks. It is often advisable to prescribe it on an 'if necessary' basis for hospitalised insulin-treated children, so that it can be given rapidly by the nurses during a hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 10% can be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 50% is not recommended, as it is very viscous and hypertonic. Close monitoring is necessary, particularly in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Children whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs can persist for many hours.

Glucagon is not effective in the treatment of hypoglycaemia due to fatty acid oxidation or glycogen storage disorders.

Chronic hypoglycaemia
Diazoxide p. 445 is useful in the management of chronic hypoglycaemia due to excessive insulin secretion, either from a tumour involving the islets of Langerhans or from persisting hyperinsulinaemic hypoglycaemia of infancy (nesidioblastosis). Diazoxide has no place in the management of acute hypoglycaemia. Chlorothiazide p. 108 reduces diazoxide-induced sodium and water retention and has the added benefit of potentiating the glycemic effect of diazoxide.

If diazoxide and chlorothiazide fail to suppress excessive glucose requirements in chronic hypoglycaemia then octreotide p. 445 or nifedipine p. 106 can be added. Octreotide suppresses secretion of growth hormone, but growth is unlikely to be affected in the long term.

Neonatal hypoglycaemia
Neonatal hypoglycaemia at birth is treated with glucose intravenous infusion 10%. Mild asymptomatic persistent hypoglycaemia may respond to a single dose of glucagon. Glucagon has also been used in the short-term management of endogenous hyperinsulinism.
### Chronic hypoglycaemia

#### Glycogenolytic Hormones

**Diazoxide**

- **Indications and Dose**
  - **Resistant hypertension**
    - **By Mouth**
      - Neonate: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day.
      - Child: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day.

- **Chronic intractable hypoglycaemia**
  - **By Mouth**
    - Neonate: Initially 5 mg/kg twice daily, adjusted according to response, initial dose used to establish response; maintenance 1.5–3 mg/kg 2–3 times a day; increased if necessary up to 7 mg/kg 3 times a day, higher doses are unlikely to be beneficial, but may be required in some cases.
    - Child: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maintenance 1.5–3 mg/kg 2–3 times a day, increased if necessary up to 5 mg/kg 3 times a day, doses up to 5 mg/kg may be required in some cases, but higher doses are unlikely to be beneficial.

- **Unlicensed Use** Not licensed for resistant hypertension.

- **Caution** Aortic coarctation • Aortic stenosis • arteriovenous shunt • heart failure • hyperuricaemia • impaired cardiac circulation • impaired cerebral circulation

- **Interactions** → Appendix 1: diazoxide

- **Side-effects** Taste disturbance • abdominal pain • anaemia • anorexia (prolonged use) • bleeding • constipation • decreased libido • dermatitis • diarrhoea • dizziness • dysphoria • eosinophilia • extrapyramidal effects • galactorrhoea • headache • heart failure • hyperglycaemia • hyperosmolar non-ketotic coma • hypertrichosis • hyperuricaemia (prolonged use) • hypotension • ileus • lacrimation • leucopenia • lichenoid eruption • musculoskeletal pain • nausea • pancreatitis • pruritus • pulmonary hypertension • raised serum creatinine • raised serum urea • reversible nephritic syndrome • sodium and fluid retention • thrombocytopenia • tinnitus • transient cataracts • visual disturbances • voice changes (prolonged use) • vomiting

- **Pregnancy** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

- **Breast Feeding** Manufacturer advises avoid—no information available.

#### Renal Impairment

Dose reduction may be required.

#### Monitoring Requirements

- Monitor blood pressure.
- Monitor white cell and platelet count during prolonged use.
- Regularly assess growth, bone, and psychological development during prolonged use.

#### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, tablet, capsule.

**Oral suspension**

- **Diazoxide (Non-proprietary)**
  - **Diazoxide 50 mg per 1 ml** Proglycem 250mg/5ml oral suspension
    - No price available
  - **Diazoxide 100 mg per 1 ml** Proglycem 500mg/10ml oral suspension
    - No price available

**Tablet**

- **Eudemine (Focus Pharmaceuticals Ltd)**
  - **Diazoxide 50 mg** Eudemine 50mg tablets
    - 100 tablet [POM] £46.45

**Capsule**

- **Diazoxide (Non-proprietary)**
  - **Diazoxide 25 mg** Proglycem 25 capsules
    - 100 capsule [POM] No price available

#### Pituitary and Hypothalamic Hormones and Analogues

**Somatostatin analogues**

- **Caution** Diabetes mellitus (antidiabetic requirements may be reduced) • insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses)

- **Side-effects**
  - Rare: Pancreatitis (shortly after administration)
  - Frequency not known: Abdominal pain • anorexia • bloating • diarrhoea • flatulence • gallstones (after long-term treatment) • gastro-intestinal disturbances • hyperglycaemia (with chronic administration) • hypoglycaemia • impaired postprandial glucose tolerance (with chronic administration) • irritation at the injection site • nausea • pain at the injection site • steatorrhoea • vomiting

- **Directions for Administration** Injection sites should be rotated.

**Octreotide**

- **Indications and Dose** Persistent hyperinsulinaemic hypoglycaemia unresponsive to diazoxide and glucose
  - **By Subcutaneous Injection**
    - Neonate: Initially 2–5 micrograms/kg every 6–8 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required.
    - Child: Initially 1–2 micrograms/kg every 4–6 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required.

- **Bleeding from oesophageal or gastric varices**
  - **By Continuous Intravenous Infusion**
    - Child: 1 microgram/kg/hour, higher doses may be required initially, when no active bleeding reduce dose over 24 hours; usual maximum 50 micrograms/hour

- **Unlicensed Use** Not licensed in children.

- **Interactions** → Appendix 1: octreotide
Disorders of bone metabolism

Bone metabolism

Disorders of bone metabolism

The two main disorders of bone metabolism that occur in children are rickets and osteoporosis. The two most common forms of rickets are Vitamin D deficiency rickets and hypophosphataemic rickets. See also calcium.

Osteoporosis

Osteoporosis in children may be primary (e.g. osteogenesis imperfecta and idiopathic juvenile osteoporosis), or secondary (e.g. due to inflammatory disorders, immobilisation, or corticosteroids); specialist management is required.

Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible.

Calcitonin

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon) p. 450 (synthetic or recombinant salmon calcitonin) is used by specialists to lower the plasma-calcium concentration in children with hypercalcaemia associated with malignancy.

Bisphosphonates

A bisphosphonate such as pamidronate disodium p. 448 is used in the management of severe forms of osteogenesis imperfecta and other causes of osteoporosis in children to reduce the number of fractures; the long-term effects of bisphosphonates in children have not been established. Single doses of bisphosphonates are also used to manage hypercalcaemia. Treatment should be initiated under specialist advice only.

Bisphosphonates

- **Drug action** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

---

**Side-effects**

Alopecia · arrhythmias · biliary colic (associated with abrupt withdrawal of subcutaneous octreotide) · bradycardia · constipation · dizziness · dyspnœa · headache · hepatitis · pancreatitis (associated with abrupt withdrawal of subcutaneous octreotide) · rash · reduced bile flow · reduced gall bladder motility

**Gastro-intestinal side-effects** Administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects.

**Conception and contraception** Effective contraception required during treatment.

**Pregnancy** Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.

**Breastfeeding** Manufacturer advises avoid.

**Monitoring requirements**
- Monitor thyroid function on long-term therapy.
- Monitor liver function.

**Treatment cessation** Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).

**Directions for administration** For intravenous injection or intravenous infusion, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Octreotide (Non-proprietary)**
  - Octreotide (as Octreotide acetate) 50 microgram per 1 ml Octreotide 50micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £18.85 DT price = £18.85 Octreotide 50micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £14.85–£18.60 Octreotide 50micrograms/1ml solution for injection vials | 5 vial [PoM] £14.87–£22.00 DT price = £22.00
  - Octreotide (as Octreotide acetate) 100 microgram per 1 ml Octreotide 100micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £32.65 DT price = £27.97 Octreotide 100micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £28.90–£32.90 Octreotide 100micrograms/1ml solution for injection vials | 5 vial [PoM] £27.97–£32.65
  - Octreotide (as Octreotide acetate) 200 microgram per 1 ml Octreotide 200micrograms/1ml solution for injection vials | 1 vial [PoM] £56.00–£69.66
  - Octreotide (as Octreotide acetate) 500 microgram per 1 ml Octreotide 500micrograms/1ml solution for injection vials | 5 vial [PoM] £135.47–£158.25 Octreotide 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £169.35 DT price = £135.47 Octreotide 500micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £139.43–£160.00

- **Sandostatin (Novartis Pharmaceuticals UK Ltd)**
  - Octreotide (as Octreotide acetate) 50 microgram per 1 ml Sandostatin 50micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £14.87
  - Octreotide (as Octreotide acetate) 100 microgram per 1 ml Sandostatin 100micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £27.97 DT price = £27.97
  - Octreotide (as Octreotide acetate) 200 microgram per 1 ml Sandostatin 1mg/5ml solution for injection vials | 1 vial [PoM] £55.73
  - Octreotide (as Octreotide acetate) 500 microgram per 1 ml Sandostatin 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £135.47 DT price = £135.47

- **Powder and solvent for suspension for injection**
  - **Sandostatin LAR (Novartis Pharmaceuticals UK Ltd)**
    - Octreotide (as Octreotide acetate) 10 mg Sandostatin LAR 10mg powder and solvent for suspension for injection vials | 1 vial [PoM] £545.71

Octreotide (as Octreotide acetate) 20 mg Sandostatin LAR 20mg powder and solvent for suspension for injection vials | 1 vial [PoM] £799.33

Octreotide (as Octreotide acetate) 30 mg Sandostatin LAR 30mg powder and solvent for suspension for injection vials | 1 vial [PoM] £998.41
Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, comorbidity, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

**MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)**

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cottonbud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

### Alendronic acid

**INDICATIONS AND DOSE**

- **Osteoporosis (due to osteogenesis imperfecta and other causes) (initiated under specialist supervision)**
  - **Hypercalcaemia (initiated under specialist supervision)**
    - **BY MOUTH**
    - **Child:** (consult local protocol)

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Common or very common** Abdominal distension, abdominal pain, constipation, diarrhoea, dyspepsia, flatulence, headache, oesophageal reactions, regurgitation
  - **Uncommon** Episcleritis, erythema, gastritis, nausea, rash, scleritis, uveitis, vomiting
  - **Rare** Atypical femoral fractures with long-term use, hypocalcaemia, osteonecrosis of the jaw, photosensitivity, severe skin reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, upper gastro-intestinal ulcers
  - **Very rare** Osteonecrosis of the external auditory canal
  - **Frequency not known** Musculoskeletal pain

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Oesophageal reactions Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAI IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 35 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

### Patient and Carer Advice

**PATIENT AND CARER ADVICE**

- **Atypical femoral fractures** Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

- **Osteonecrosis of the jaw** During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms. Osteonecrosis of the external auditory canal Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.
● NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (April 2016) that alendronic acid (Binosto®) is accepted for restricted use within NHS Scotland for the treatment of postmenopausal osteoporosis where alendronic acid is the appropriate treatment choice, but the patient is unable to swallow tablets.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Oral solution**
- **Alendronic acid (Non-proprietary)**
  - Alendronic acid 700 microgram per 1 ml
  - Alendronic acid 70mg/100ml oral solution unit dose sugar-free sugar-free | 4 unit dose (Posm) £27.36 DT price = £27.36

**Effervescent tablet**
- **Binosto (Internis Pharmaceuticals Ltd)**
  - Alendronic acid (as Alendronate sodium) 70 mg

**Tablet**
- **Alendronic acid (Non-proprietary)**
  - Alendronic acid (as Alendronate sodium) 10 mg
  - Alendronic acid 10mg tablets | 28 tablet (Posm) £3.25 DT price = £1.83
  - Alendronic acid (as Alendronate sodium) 70 mg
  - Alendronic acid 70mg tablets | 4 tablet (Posm) £22.80 DT price = £0.74
- **Fosamax (Merck Sharp & Dohme Ltd)**
  - Alendronic acid (as Alendronate sodium) 10 mg
  - Fosamax 10mg tablets | 28 tablet (Posm) £23.12 DT price = £1.83
  - Alendronic acid (as Alendronate sodium) 70 mg
  - Fosamax Once Weekly 70mg tablets | 4 tablet (Posm) £22.80 DT price = £0.74

**Pamidronate disodium**
(Formerly called aminohydroxypropyldenediphosphate disodium (APD))

● **INDICATIONS AND DOSE**
Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) / Hypercalcaemia (specialist use only)
- BY INTRAVENOUS INFUSION
- Child: (consult product literature)

● **UNLICENSED USE** Not licensed for use in children.

● **CAUTIONS** Atypical femoral fractures | cardiac disease | ensure adequate hydration | previous thyroid surgery (risk of hypocalcaemia)

● **INTERACTIONS** Appendix 1: bisphosphonates

● **SIDE-EFFECTS**
- Common or very common Arthralgia | bone pain | fever | headache | hypomagnesaemia | hypophosphataemia | influenza | like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes) | lymphyocytopenia | myalgia | nausea | transient rise in body temperature | vomiting
- Rare Abdominal pain | acute renal failure | agitation | anaemia | anorexia | atypical femoral fractures | confusion | conjunctivitis | constipation | deterioration of renal disease | diarrhoea | dizziness | dyspepsia | haematuria | hallucinations | hyperkalaemia | hypernatraemia | hypertension | hypokalaemia | hypotension | insomnia | isolated cases of seizures | lethargy | leucopenia | muscle cramps | osteonecrosis of the jaw | other ocular symptoms | paraesthesia | pruritus | rash | somnolence | symptomatic hypocalcaemia | tetany | thrombocytopenia
- Very rare Osteonecrosis of the external auditory canal

● **Frequency not known** Atrial fibrillation | injection-site reactions | reactivation of herpes simplex | reactivation of herpes zoster

● **PREGNANCY** Avoid—toxicity in animal studies.

● **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—no information available.

● **RENAL IMPAIRMENT** Monitor renal function in renal disease or predisposition to renal impairment (e.g. in tumour-induced hypercalcaemia).

**DIrections for administration** For slow intravenous infusion (Aredia®, Pamidronate disodium, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium.

For Aredia®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For Pamidronate disodium (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.

● **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw).

Driving and skilled tasks
Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

**Solution for infusion**

- **Pamidronate disodium (Non-proprietary)**
  - Pamidronate disodium 3 mg per 1 ml
  - Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial (Posm) £27.50 (Hospital only) | 5 vial (Posm) £149.15
  - Pamidronate disodium 30mg/10ml solution for infusion vials | 1 vial (Posm) £55.00 (Hospital only) | 1 vial (Posm) £59.66
  - Pamidronate disodium 60mg/20ml solution for infusion vials | 1 vial (Posm) £110.00 (Hospital only) | Pamidronate disodium 90mg/30ml solution for infusion vials | 1 vial (Posm) £165.00 (Hospital only)
  - Pamidronate disodium 9 mg per 1 ml
  - Pamidronate disodium 90mg/10ml solution for infusion vials | 1 vial (Posm) £170.45
  - Pamidronate disodium 15 mg per 1 ml
  - Pamidronate disodium 60mg/4ml solution for infusion ampoules | 1 ampoule (Posm) £119.32
  - Pamidronate disodium 15mg/1ml solution for infusion ampoules | 4 ampoule (Posm) £119.32
  - Pamidronate disodium 90mg/6ml solution for infusion ampoules | 1 ampoule (Posm) £170.45
  - Pamidronate disodium 30mg/2ml solution for infusion ampoules | 2 ampoule (Posm) £119.32

**Risedronate sodium**

● **INDICATIONS AND DOSE**
Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) / Hypercalcaemia (specialist use only)
- BY MOUTH
- Child: (consult local protocol)

● **UNLICENSED USE** Not licensed for use in children.

● **CONTRA-INDICATIONS** Hypocalcaemia

● **CAUTIONS** Atypical femoral fractures | oesophageal abnormalities | other factors which delay transit or emptying (e.g. stricture or achalasia)

● **INTERACTIONS** Appendix 1: bisphosphonates

● **SIDE-EFFECTS**
- Common or very common Abdominal pain | constipation | diarrhoea | dyspepsia | headache | musculoskeletal pain | nausea
**Sodium clodronate**

- **INDICATIONS AND DOSE**
  - Osteoporosis (due to osteogenesis imperfecta or other causes) (specialist use only) | Hypercalcaemia (specialist use only)
  - **BY MOUTH**
  - Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Acute gastro-intestinal inflammatory conditions

- **CAUTIONS** Atypical femoral fractures - maintain adequate fluid intake during treatment.

- **INTERACTIONS** → Appendix 1: bisphosphonates

- **SIDE-EFFECTS**
  - Common or very common Bronchospasm, diarrhoea, nausea, skin reactions, vomiting
  - Rare Atypical femoral fractures
  - Very rare Osteonecrosis of the external auditory canal
  - Frequency not known Renal impairment, uveitis

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **RENAI IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Correct hypocalcaemia before starting.
  - Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.

- **DIRECTIONS FOR ADMINISTRATION** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer risedronate sodium tablets.
  - Oesophageal reactions: Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

- **MEDICINAL FORMS**

  **Tablet**
  - **Risedronate sodium (Non-proprietary)**
    - **Risedronate sodium 5 mg**
      - 28 tablet [Pom] £24.78 DT price = £18.85
    - **Risedronate sodium 30 mg**
      - 28 tablet [Pom] £143.95 DT price = £143.83
    - **Risedronate sodium 35 mg**
      - 4 tablet [Pom] £19.12 DT price = £0.85
  - **Actonel** (Warner Chilcott Ltd, Teva UK Ltd)
    - **Risedronate sodium 5 mg**
      - 28 tablet [Pom] £17.99 DT price = £18.85
    - **Risedronate sodium 30 mg**
      - 28 tablet [Pom] £143.95 DT price = £143.83
    - **Risedronate sodium 35 mg**
      - 4 tablet [Pom] £19.12 DT price = £0.85

- **MEDICAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **CAUTIONARY AND ADVISORY LABELS**
    - **Sodium clodronate (Non-proprietary)**
      - **Sodium clodronate 800 mg**
        - 60 tablet [Pom] £116.72 DT price = £146.43
    - **Bonefos** (Bayer Plc)
      - **Sodium clodronate 800 mg**
        - 60 tablet [Pom] £146.43 DT price = £146.43
    - **Clasteon** (Beacon Pharmaceuticals Ltd)
      - **Sodium clodronate 800 mg**
        - 60 tablet [Pom] £146.43 DT price = £146.43
    - **Loron** (Intrapharm Laboratories Ltd)
      - **Sodium clodronate 520 mg**
        - 60 tablet [Pom] £152.59 DT price = £152.59

  **Capsule**
  - **Sodium clodronate 400 mg**
    - 120 capsule [Pom] £139.83 DT price = £139.83
  - **Bonefos** (Bayer Plc)
    - **Sodium clodronate 400 mg**
      - 120 capsule [Pom] £139.83 DT price = £139.83
  - **Clasteon** (Beacon Pharmaceuticals Ltd)
    - **Sodium clodronate 400 mg**
      - 30 capsule [Pom] £34.96 | 120 capsule [Pom] £139.83 DT price = £139.83

**Disorders of bone metabolism** 449
**Calcitonin (salmon)**
(Salcatonin)

- **INDICATIONS AND DOSE**
  - Hypercalcaemia (limited experience in children) (specialist use only)
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Child: 2.5–5 units/kg every 12 hours (max. per dose 400 units every 6–8 hours), adjusted according to response, no additional benefit with doses over 8 units/kg every 6 hours
    - **BY INTRAVENOUS INFUSION**
    - Child: 5–10 units/kg, to be administered by slow intravenous infusion over at least 6 hours
  - Osteoporosis (specialist use only)
    - **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
    - Child: Refer for specialist advice, experience very limited

- **UNLICENSED USE** Not licensed in children.
- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Heart failure - history of allergy (skin test advised) - risk of malignancy — avoid prolonged use (use lowest effective dose for shortest possible time)
- **INTERACTIONS** → Appendix 1: calcitonin (salmon)
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - diarrhoea - dizziness - fatigue - flushing - headache - malignancy (with long-term use) - musculoskeletal pain - nausea - taste disturbances - vomiting
  - Uncommon Cough - hypersensitivity reactions - hypertension - injection-site reactions - oedema - polyuria - pruritus - rash - visual disturbances
  - Frequency not known Tremor
- **PREGNANCY** Avoid unless potential benefit outweighs risks (toxicity in animal studies).
- **BREAST FEEDING** Avoid; inhibits lactation in animals.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Monitor bone growth.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute injection solution (e.g. 400 units in 500 mL) with Sodium Chloride 0.9% and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration—use diluted solution without delay.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - Calcitonin (salmon) (Non-proprietary)
      - Calcitonin (salmon) 50 unit per 1 ml Calcitonin (salmon) 50 units/1ml solution for injection ampoules | 5 ampoule (PXM) £167.50
      - Calcitonin (salmon) 100 unit per 1 ml Calcitonin (salmon) 100 units/1ml solution for injection ampoules | 5 ampoule (PXM) £220.00
      - Calcitonin (salmon) 200 unit per 1 ml Calcitonin (salmon) 400 units/2ml solution for injection vials | 1 vial (PXM) £352.00

---

**5 Gonadotrophin responsive conditions**

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES**

### Gosereolin
- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

- **INDICATIONS AND DOSE**
  - **ZOLADEX®**
    - Gonadotrophin-dependent precocious puberty
      - **BY SUBCUTANEOUS INJECTION**
      - Child: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases
  - **ZOLADEX®**
    - Gonadotrophin-dependent precocious puberty
      - **BY SUBCUTANEOUS INJECTION**
      - Child: 3.6 mg every 28 days, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **CAUTIONS** Depression - patients with metabolic bone disease (decrease in bone mineral density can occur)

- **SIDE-EFFECTS**
  - Anaphylaxis - asthma - breast tenderness - changes in blood pressure - changes in breast size - changes in scalp and body hair - depression - headache - hypersensitivity reactions - local reactions at injection site - mood changes - ovarian cysts (may require withdrawal) - paraesthesia - pruritus - rash - urticaria - vaginal bleeding - visual disturbances - weight change - withdrawal bleeding
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.

- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Implant**
    - **Zoladex** (AstraZeneca UK Ltd)
      - Gosereolin (as Gosereolin acetate) 3.6 mg Zoladex 3.6mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection (PXM) £65.00 DT price = £65.00
    - **Zoladex LA** (AstraZeneca UK Ltd)
      - Gosereolin (as Gosereolin acetate) 10.8 mg Zoladex LA 10.8mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection (PXM) £235.00 DT price = £235.00
**Gonadotrophin responsive conditions** 451

### Leuprorelin acetate

**Drug Action** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle-stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**Unlicensed Use** Not licensed for use in children.

**Contra-Indications** Undiagnosed vaginal bleeding

**Side-Effects** Anaphylaxis - arthralgia - asthenia - asthma - breast tenderness (males and females) - changes in blood pressure - changes in breast size - changes in scalp and body hair - depression - gastro-intestinal disturbances - headache - hypersensitivity reactions - local reactions at injection site - mood changes - ovarian cysts (may require withdrawal) - paraesthesia - pruritus - rash - urticaria - visual disturbances - weight changes - withdrawal bleeding (may occur in the first month of treatment)

**Conception and Contraception** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

**Pregnancy** Avoid.

**Breast Feeding** Avoid.

**Monitoring Requirements** Monitor bone mineral density.

**Directions for Administration** Rotate injection site to prevent atrophy and nodule formation.

**Prescribing and Dispensing Information**

**Decapeptyl® SR 11.25mg** Each vial includes an overage to allow accurate administration of an 11.25 mg dose.
6 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Corticotrophins

Tetracosactide below (tetracosactrin), an analogue of corticotropin (adrenocorticotropic hormone, ACTH), is used to test adrenocortical function; failure of plasma-cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency. A low-dose test is considered by some clinicians to be more sensitive when used to confirm established, partial adrenal suppression.

Tetracosactide should be given only if no other ACTH deficiency. A standard-dose test (Synacthen Depot®) is also used in the treatment of infantile spasms but it is contra-indicated in neonates because of the presence of benzyl alcohol in the injection. Corticotropin-releasing factor, corticorelin p. 453, (also known as corticotent-releasing hormone, CRH) is used to test anterior pituitary function and secretion of corticotropin.

Gonadotrophins

 Gonadotrophins are occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligosperma. There is no justification for their use in primary gonadal failure.

Choric gonadotrophin p. 454 is used in the investigation of testicular function in suspected primary hypogonadism and incomplete masculinisation. It has also been used in delayed puberty in boys to stimulate endogenous testosterone production, but it has little advantage over testosterone.

Growth hormone

Growth hormone is used to treat proven deficiency of the hormone, Prader-Willi syndrome, Turner’s syndrome, growth disturbance in children born small for corrected gestational age, chronic renal insufficiency, and short stature homebox-containing gene (SHOX) deficiency. Growth hormone is also used in Noonan syndrome and idiopathic short stature [unlicensed indications] under specialist management. Treatment should be initiated and monitored by a paediatrician with expertise in managing growth-hormone disorders; treatment can be continued under a shared-care protocol by a general practitioner.

6.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPINS

Tetracosactide

(Tetracosactrin)

INDICATIONS AND DOSE

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), standard-dose test

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Child: 145 micrograms/m² (max. per dose 250 micrograms) for 1 dose

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), low-dose test

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Child: 0.3 microgram/m² for 1 dose

Infantile spasms

- BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION
- Child 1-23 months: Initially 500 micrograms once daily on alternate days, adjusted according to response

CONTRA-INDICATIONS Acute psychosis • adrenogenital syndrome • allergic disorders • asthma • avoid injections containing benzyl alcohol in neonates • Cushings syndrome • infectious diseases • peptic ulcer • primary adrenocortical insufficiency • refractory heart failure

CAUTIONS Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) • active systemic diseases (should not be used unless adequate disease-specific therapy is being given) • diabetes mellitus • diverticulitis • history of asthma • history of atopic allergy • history of eczema • history of hayfever • history of hypersensitivity • hypertension • latent ameobiasis (may become activated) • latent tuberculosis (may become activated) • myasthenia gravis • ocular herpes simplex • osteoporosis • predisposition to thromboembolic psychological disturbances may be triggered • recent intestinal anastomosis • reduced immune response (should

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 454, produced using recombinant DNA technology.

Mecasermin p. 456, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 453 when injected intravenously in post-pubertal girls leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. It is used in the assessment of delayed or precocious puberty.

Other growth hormone stimulation tests involve the use of insulin, glucagon p. 444, arginine p. 586, and clonidine hydrochloride p. 99 [all unlicensed uses]. The tests should be carried out in specialist centres.
not be used unless adequate disease-specific therapy is being given) - ulcerative colitis

**CAUTIONS, FURTHER INFORMATION**

- Risk of anaphylaxis: Should only be administered under medical supervision. Consult product literature.
- Hypertension: Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
- Diabetes mellitus: Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.

**PREGNANCY** Avoid (but may be used diagnostically if essential).

**BREAST FEEDING** Avoid (but may be used diagnostically if essential).

**HEPATIC IMPAIRMENT** An enhanced effect of tetracosactide therapy may occur in patients with cirrhosis of the liver. Use with caution in hepatic impairment. Monitor hepatic function closely during treatment.

**RENAL IMPAIRMENT** Use with caution in patients with renal impairment.

**EFFECT ON LABORATORY TESTS** May suppress skin test reactions.

Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.

**DIRECTIONS FOR ADMINISTRATION** For intramuscular or intravenous injection, may be diluted in sodium chloride 0.9% to 250 nanograms/mL.
6.3 Gonadotrophin replacement therapy

**GONADOTROPHINS**

**Chorionic gonadotrophin**

(Human chorionic gonadotrophin; HCG)

- **DRUG ACTION** A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

- **INDICATIONS AND DOSE**
  - **Delayed puberty in the male to stimulate endogenous testosterone production**
    - **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
    - Child: (consult product literature)
  - **Test of testicular function, short stimulation test**
    - **BY INTRAMUSCULAR INJECTION**
    - Child: 1500–2000 units once daily for 3 days
  - **Test of testicular function, prolonged stimulation test**
    - **BY INTRAMUSCULAR INJECTION**
    - Child: 1500–2000 units twice weekly for 3 weeks
  - **Hypogonadotropic hypogonadism**
    - **BY INTRAMUSCULAR INJECTION**
    - Child: 1000–2000 units twice weekly, adjusted according to response
  - **Undescended testes**
    - **BY INTRAMUSCULAR INJECTION**
    - Child 7–16 years: Initially 500 units 3 times a week, adjusted according to response to up to 4000 units 3 times a week continue for 1–2 months after testicular descent
    - Child 17 years: Initially 1000 units twice weekly, adjusted according to response to up to 4000 units 3 times a week continue for 1–2 months after testicular descent

- **UNLICENSED USE** Unlicensed in children for test of testicular function.

- **CONTRA-INDICATIONS** Androgen-dependent tumours

- **CAUTIONS** Asthma • cardiac impairment • epilepsy • migraine • prepubertal boys (risk of premature epiphyseal closure or precocious puberty)

- **SIDE-EFFECTS** Gynaecomastia • headache • local reactions • mood changes • oedema (particularly in males—reduce dose) • tiredness

- **RENAL IMPAIRMENT** Use with caution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder and solvent for solution for injection**
    - **Choragon** (Ferring Pharmaceuticals Ltd)
      - Chorionic gonadotrophin human 5000 unit Powder and solvent for solution for injection ampoules 3 ampoules [Box] £3.77 [C4-2]
    - **Pregnyl** (Merck Sharp & Dohme Ltd)
      - Chorionic gonadotrophin human 5000 unit Powder and solvent for solution for injection ampoules 1 ampoule [Box] £2.12 [C4-2]
  - **Chorionic gonadotrophin human 1500 unit**
    - Pregnyl 1,500unit powder and solvent for solution for injection ampoules 1 ampoule [Box] £3.15 [C4-2]

6.4 Growth hormone disorders

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES**

**Somatropin**

(Recombinant Human Growth Hormone)

- **INDICATIONS AND DOSE**
  - **Gonadal dysgenesis (Turner syndrome)**
    - **BY SUBCUTANEOUS INJECTION**
      - Child: 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily
  - **Deficiency of growth hormone**
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
      - Child: 23–39 micrograms/kg daily, alternatively 0.7–1 mg/m² daily
  - **Growth disturbance in children born small for gestational age whose growth has not caught up by 4 years or later | Noonan syndrome**
    - **BY SUBCUTANEOUS INJECTION**
      - Child 4-17 years: 35 micrograms/kg daily, alternatively 1 mg/m² daily
  - **Prader-Willi syndrome, in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet**
    - **BY SUBCUTANEOUS INJECTION**
      - Child: 1 mg/m² daily, alternatively 35 micrograms/kg daily; maximum 2.7 mg per day
  - **Chronic renal insufficiency (renal function decreased to less than 50%)**
    - **BY SUBCUTANEOUS INJECTION**
      - Child: 45–50 micrograms/kg daily, alternatively 1.4 mg/m² daily, higher doses may be needed, adjust if necessary after 6 months
  - **SHOX deficiency**
    - **BY SUBCUTANEOUS INJECTION**
      - Child: 45–50 micrograms/kg daily
  - **DOSE EQUIVALENCE AND CONVERSION**
    - **Dose formerly expressed in units; somatropin 1 mg = 3 units.**

- **UNLICENSED USE** Not licensed for use in Noonan syndrome.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates • evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) • not to be used after renal transplantation • not to be used for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome) • severe obesity in Prader-Willi syndrome • severe respiratory impairment in Prader-Willi syndrome

- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) • disorders of the epiphysis of the hip (monitor for limping) • history of malignant disease • hypothyroidism — manufacturers recommend periodic thyroid function tests but limited evidence of clinical value • initiation of treatment close to puberty not recommended in child born small for corrected gestational age • papilloedema • relative deficiencies of other pituitary hormones • resolved intracranial hypertension (monitor closely) • Silver-Russell syndrome

- **INTERACTIONS** → Appendix 1: somatropin

- **SIDE-EFFECTS** Antibody formation • arthralgia • benign intracranial hypertension • carpal tunnel syndrome • fluid retention (peripheral oedema) • headache • hyperglycaemia • hypoglycaemia • hypothyroidism • insulin resistance •
leukaemia in children with growth hormone deficiency • myalgia • nausea • papilloedema • paraesthesia • reactions at injection site • visual problems • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

• Papilloedema Funduscopic for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur— if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

◆ PREGNANCY Discontinue if pregnancy occurs— no information available.

◆ BREAST FEEDING No information available. Absorption from milk unlikely.

◆ DIRECTIONS FOR ADMINISTRATION Rotate subcutaneous injection sites to prevent lipoatrophy.

GENOTROPIN®, NORDITROPIN®, NUTROPINAQ®, OMNITROPE®, SAIZEN®, ZOMACTON® For use by subcutaneous injection.

HUMATROPE® Cartridges for use by subcutaneous injection. Powder for reconstitution for use by subcutaneous or intramuscular injection.

◆ PRESCRIBING AND DISPENSING INFORMATION Somatropin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

SAIZEN® SOLUTION FOR INJECTION For use with cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

NUTROPINAQ® For use with NutropinAq® Pen device (non-NHS but available free of charge from clinics).

OMNITROPE® For use with Omnitrope Pen 5® and Omnitrope Pen 10® devices (non-NHS but available free of charge from clinics).

NORDITROPIN® PREPARATIONS Cartridges are for use with appropriate NordiPen® device (non-NHS but available free of charge from clinics). Multidose disposable prefilled pens for use with NovoFine® or NovoTwist® needles.

ZOMACTON® 4 mg vial for use with Zomafet 2® Vision needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

10 mg vial for use with Zomafet Vision X® needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

GENOTROPIN® PREPARATIONS Cartridges are for use with Genotropin® Pen device (non-NHS but available free of charge from clinics).

SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION For use with one. click® autoinjector device or cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

◆ NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

• Somatropin for the treatment of growth failure in children (May 2010) NICE TA188

Somatropin is recommended for children with growth failure who:

• have growth-hormone deficiency
• have Turner syndrome
• have Prader-Willi syndrome
• have chronic renal insufficiency
• are born small for gestational age with subsequent growth failure at 4 years of age or later
• have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA188

◆ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyal alcohol

• Norditropin NordiFlex (Novo Nordisk Ltd)

Somatropin (epr) 5.3 mg per 1 ml Norditropin NordiFlex 5mg/1.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection (Pom) £115.90 (CD4-2)

Somatropin (rbe) 600 microgram Genotropin MiniQuick 600microgram powder and solvent for solution for injection pre-filled
1. **Sex hormone responsive conditions**

**Sex hormones**

**Hormone replacement therapy**

Sex hormone replacement therapy is indicated in children for the treatment of gonadotrophin deficiency, gonadal disorders, or delayed puberty that interferes with quality of life. Indications include constitutional delay in puberty, sex hormone replacement therapy is generally started at the onset of puberty, adjusted to allow normal development.

**SIDE-EFFECTS**

- Antibody formation
- arthralgia
- cardiomegaly
- convulsions
- dizziness
- gynaecomastia
- headache
- hyperglycaemia
- hypoglycaemia (especially in first month, and in younger children)
- impaired hearing
- injection-site reactions (rotate site)
- myalgia
- nausea
- nervousness
- night terrors
- severe or recurrent headache
- sleep apnoea
- tachycardia
- tinnitus
- hypertrophy
- ventricular hypertrophy
- visual disturbance
- visual problems
- vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Papilloedema: Fundoscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

**CONCEPTION AND CONTRACEPTION**

Contraception advised in women of child-bearing potential.

- PREGNANCY: Avoid unless essential.

**BREAST FEEDING**

- Avoid.

**MONITORING REQUIREMENTS**

- Monitor ECG before and on termination of treatment (and during treatment if ECG abnormal).
- Monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions).
- DIRECTIONS FOR ADMINISTRATION

- Dose should be administered just before or after food.

- PATIENT AND CARER ADVICE

- Patients or carers should be given advice on how to administer mecasermin injection.

- Missed doses

Patients or carers should be advised not to increase dose if a dose is missed.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Benzyl alcohol

- Increlex (Ipsen Ltd)▼

- Mecasermin 10 mg per 1 ml Increlex 40mg/4ml solution for injection vials | 1 vial [POM] £605.00

---

### 6.4a Insulin-like growth factor-I deficiency

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES ▶ SOMATOMEDINS**

<table>
<thead>
<tr>
<th>Mecasermin</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Recombinant human insulin-like growth factor-I; rhIGF-I)</td>
</tr>
</tbody>
</table>

**DRUG ACTION**

Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotropic effects of human growth hormone.

**INDICATIONS AND DOSE**

**Treatment of growth failure in children with severe primary insulin-like growth factor-I deficiency**

- **BY SUBCUTANEOUS INJECTION**
  - Child 2-17 years: Initially 40 micrograms/kg twice daily for 1 week, increased, if tolerated, in steps of 40 micrograms/kg (max. per dose 120 micrograms/kg twice daily), discontinue if no response within 1 year, reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

- **CONTRA-INDICATIONS**
  - Evidence of tumour activity (discontinue treatment)

- **CAUTIONS**
  - Correct hypothyroidism before initiating treatment
  - diabetes mellitus (adjustment of antidiabetic therapy may be necessary)
  - papilloedema

---

**SIDE-EFFECTS**

- Antibody formation
- arthralgia
- cardiomegaly
- convulsions
- dizziness
- gynaecomastia
- headache
- hyperglycaemia
- hypoglycaemia (especially in first month, and in younger children)
- impaired hearing
- injection-site reactions (rotate site)
- myalgia
- nausea
- nervousness
- night terrors
- severe or recurrent headache
- sleep apnoea
- tachycardia
- tinnitus
- hypertrophy
- ventricular hypertrophy
- visual disturbance
- visual problems
- vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Papilloedema: Fundoscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

**CONCEPTION AND CONTRACEPTION**

Contraception advised in women of child-bearing potential.

- PREGNANCY: Avoid unless essential.

**BREAST FEEDING**

- Avoid.

**MONITORING REQUIREMENTS**

- Monitor ECG before and on termination of treatment (and during treatment if ECG abnormal).
- Monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions).
- DIRECTIONS FOR ADMINISTRATION

- Dose should be administered just before or after food.

- PATIENT AND CARER ADVICE

- Patients or carers should be given advice on how to administer mecasermin injection.

- Missed doses

Patients or carers should be advised not to increase dose if a dose is missed.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Benzyl alcohol

- Increlex (Ipsen Ltd)▼

- Mecasermin 10 mg per 1 ml Increlex 40mg/4ml solution for injection vials | 1 vial [POM] £605.00
Inadequate treatment may lead to poor bone mineralisation, resulting in fractures and osteoporosis.

Female sex hormones

**Oestrogens**

Oestrogens are necessary for the development of female secondary sexual characteristics. If onset of puberty is delayed because of organic pathology, puberty can be induced with ethinylestradiol below in increasing doses, guided by breast staging and uterine scans. Cyclical progestogen replacement is added after 12–18 months of oestrogen treatment. Once the adult dosage of oestrogen has been reached, it may be more convenient to provide replacement either as a low-dose oestrogen containing oral contraceptive formulation [unlicensed indication] or as a combined oestrogen and progestogen hormone replacement therapy preparation [unlicensed indication]. There is limited experience in the use of transdermal patches or gels in children; compliance and skin irritation are sometimes a problem.

Ethinylestradiol is occasionally used, under specialist supervision, for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited), for the prevention of tall stature, and in tests of growth hormone secretion.

Topical oestrogen creams are used in the treatment of labial adhesions.

**Progestogens**

There are two main groups of progestogen, progestrone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 489) and testosterone analogues (norethisterone p. 458 and norgestrel). The newer progestogens (desogestrel p. 485, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 486 is the active isomer of norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

In delayed puberty cyclical progestogen is added after 12–18 months of oestrogen therapy to establish a menstrual cycle.

Norethisterone is also used to postpone menstruation during a cycle; treatment is started 3 days before the expected onset of menstruation.

### 7.1 Female sex hormone responsive conditions

**OESTROGENS**

**Ethinylestradiol**

(Ethinyloestradiol)

- **INDICATIONS AND DOSE**
  - **Induction of sexual maturation in girls**
    - **BY MOUTH**
      - Child (female): Initially 2 micrograms daily for 6 months, then increased to 5 micrograms daily for 6 months, then increased to 10 micrograms daily for 6 months, then increased to 20 micrograms daily, after 12–18 months of treatment give progestogen for 7 days of each 28-day cycle.
  - **Maintenance of sexual maturation in girls**
    - **BY MOUTH**
      - Child (female): 20 micrograms daily, to be given with cyclical progestogen for 7 days of each 28-day cycle.

**Prevention of tall stature in girls**

- **BY MOUTH**
  - Child 2–11 years (female): 20–50 micrograms daily.

**Pituitary priming before growth hormone secretion test in girls with bone age over 10 years**

- **BY MOUTH**
  - Child (female): 100 micrograms daily for 3 days before test.

- **UNLICENSED USE** Unlicensed for use in children.

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice. Crohn’s disease – gene mutations associated with breast cancer (e.g. BRCA 1) – history of severe depression (especially if induced by hormonal contraceptive) – hyperprolactinaemia (seek specialist advice) – inflammatory bowel disease – migraine (migraine-like headaches) – personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) – risk factors for arterial disease – risk factors for migraine – risk factors for venous thromboembolism – sickle-cell disease – undiagnosed breast mass

**CAUTIONS, FURTHER INFORMATION**

- Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from treatment.

- **Risk of venous thromboembolism** Use with caution if any of following factors present but avoid if two or more factors present:
  - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - obesity—body mass index ≥30 kg/m² (avoid if body mass index ≥35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
  - history of superficial thrombophlebitis;
  - smoking.

- **Risk factors for arterial disease** Use with caution if any one of following factors present but avoid if two or more factors present:
  - family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
Induction and maintenance of sexual maturation in females (combined with an oestrogen after 12–18 months oestrogen therapy)

- **BY MOUTH**
  - Child: 5 mg once daily for the last 7 days of 28-day cycle

Short-term contraception

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

Contraception

- **BY MOUTH**
  - Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’

Possible rare cases

- **DIABETES MELLITUS**
  - Use as a contraceptive in co-morbidities
  - Avoid until weaning or for 21 days

- **FEMALES OF CHILDREARING POTENTIAL**
  - When used for induction and maintenance of sexual maturation in early cycles
  - Avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and jaundice.

- **MIGRAINE**
  - Avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and jaundice.

- **HEPATIX**
  - Avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and jaundice.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

  **Tablet**
  - **Ethinylestradiol (Non-proprietary)**
  - **Ethinylestradiol 10 microgram** Ethinylestradiol 10microgram tablets | 21 tablet (PoS) £200.00 DT price = £200.00
  - **Ethinylestradiol 50 microgram** Ethinylestradiol 50microgram tablets | 21 tablet (PoS) £200.00 DT price = £200.00
  - **Ethinylestradiol 1 mg** Ethinylestradiol 1mg tablets | 28 tablet (PoM) £200.00.00 DT price = £200.00

**PROGESTOGENS**

**Norethisterone**

- **INDICATIONS AND DOSE**
  - **POSTPONEMENT OF MENSTRUATION**
    - **BY MOUTH**
    - Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)
Breast cancer risk with contraceptive use — There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **INTERACTIONS** → Appendix 1: norethisterone
- **SIDE-EFFECTS**

  **GENERAL SIDE-EFFECTS**
  Acne · alopecia · anaphylactoid reactions · breast tenderness · change in libido · depression · disturbance of appetite · dizziness · fluid retention · headache · hirsutism · insomnia (non-progestogen indications) · jaundice · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · urticaria · vomiting · weight change

  **SPECIFIC SIDE-EFFECTS**
  - With intramuscular use: Injection-site reactions
  - SIDE-EFFECTS, FURTHER INFORMATION

  **Cervical cancer** Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives (use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years). The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

- **PREGNANCY** Not known to be harmful in contraceptive doses. Avoid in other indications.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

- With intramuscular use: Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

- **HEPATIC IMPAIRMENT** When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Caution when used for sexual maturation and to postpone menstruation; avoid if severe.

- **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.

- **PATIENT AND CARER ADVICE**

  **Missed oral contraceptive pill** The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.’

  The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

  Diarrhoea and vomiting with oral contraceptives. Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

  Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

  Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

  After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

  Contraceptives by injection Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Solution for injection**
  - Noristerat (Bayer Plc) Norethisterone enantate 200 mg per 1 ml Noristerat 200mg/1ml solution for injection ampoules | 1 ampoule P® £4.05

  **Tablet**
  - Norethisterone (Non-proprietary) Norethisterone 5 mg Norethisterone 5mg tablets | 30 tablet P® £2.48 DT price = £2.18

  - Noriday (Pfizer Ltd) Noriday 350 microgram Noriday 350microgram tablets | 84 tablet P® £2.10 DT price = £1.80

  - Primolut N (Bayer Plc) Norethisterone 5 mg Primolut N 5mg tablets | 30 tablet P® £2.18

### 7.2 Male sex hormone responsive conditions

#### Androgens, anti-androgens and anabolic steroids

**Androgens**

Androgens cause masculinisation; they are used as replacement therapy in androgen deficiency, in delayed puberty, and in those who are hypogonadal due to either pituitary or testicular disease.

When given to patients with hypopituitarism androgens can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which stimulates spermatogenesis as well as androgen production.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate or propionate or alternatively Sustanon®, which consists of a mixture of testosterone esters and has a longer duration of action, can be used. For induction of puberty, depot testosterone injections are given monthly and the
sex hormone responsive conditions

---

**Anti-androgens and precocious puberty**

The gonadorelin stimulation test is used to distinguish between gonadotrophin-dependent (central) precocious puberty and gonadotrophin-independent precocious puberty. Treatment requires specialist management.

Gonadorelin analogues, used in the management of gonadotrophin-dependent precocious puberty, delay development of secondary sexual characteristics and growth velocity.

Testolactone p. 462 and cyproterone acetate p. 461 are used in the management of gonadotrophin-independent precocious puberty, resulting from McCune-Albright syndrome, familial male precocious puberty (testotoxicosis), hormone-secreting tumours, and ovarian and testicular disorders. Testolactone inhibits the aromatisation of testosterone, the rate limiting step in oestrogen synthesis. Cyproterone acetate is a progestogen with anti-androgen blocking properties.

Spironolactone p. 123 is sometimes used in combination with testolactone because it has some androgen receptor blocking properties.

High blood concentration of sex hormones may activate release of gonadotrophin releasing hormone, leading to development of secondary, central gonadotrophin-dependent precocious puberty. This may require the addition of gonadorelin analogues to prevent progression of pubertal development and skeletal maturation.

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in girls. They are used in the treatment of some aplastic anaemias.

Oxandrolone is used to stimulate late pre-pubertal growth prior to induction of sexual maturation in boys with short stature and in girls with Turner’s syndrome; specialist management is required.

8 Thyroid disorders

8.1 Hyperthyroidism

Antithyroid drugs

Overview

Antithyroid drugs are used for hyperthyroidism either to prepare children for thyroidectomy or for long-term management. In the UK carbimazole p. 463 is the most commonly used drug. Propylthiouracil p. 463 should be reserved for children who are intolerant of, or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Treatment in children should be undertaken by a specialist. Carbimazole or propylthiouracil are initially given in large doses to block thyroid function. This dose is continued until the child becomes euthyroid, usually after 4 to 8 weeks, and is then gradually reduced to a maintenance dose of 30–60% of the initial dose. Alternatively high-dose treatment is continued in combination with levothyroxine sodium p. 464 replacement (blocking-replacement regimen); this is particularly useful when dose adjustment proves difficult. Treatment is usually continued for 12 to 24 months. The blocking-replacement regimen is not suitable during pregnancy. Hypothyroidism should be avoided particularly during pregnancy as it can cause fetal goitre.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (¹³¹I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 101 is useful for rapid relief of thyrotoxic symptoms and can be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but atenolol p. 103 is also used.

Thyrotoxic crisis (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 420 as sodium succinate, as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

Pregnancy

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

Neonates

Neonatal hyperthyroidism is treated with carbimazole or propylthiouracil, usually for 8 to 12 weeks. In severe symptomatic disease iodine may be needed to block the thyroid and propranolol required to treat peripheral symptoms.
ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

**Carbamazole**

### INDICATIONS AND DOSE

#### Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

- **BY MOUTH**
- Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

**Hyperthyroidism (including Graves' disease)**

- **BY MOUTH**

- Neonate: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses.
- Child 1 month-11 years: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses; maximum 30 mg per day
- Child 12-17 years: Initially 30 mg daily until euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses.

#### DOSE EQUIVALENT AND CONVERSION

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

### IMPORTANT SAFETY INFORMATION

**NEUTROPENIA AND AGRAUNLCYTOSIS**

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.

**Carbamazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.**

### INTERACTIONS

- Appendix 1: carbimazole

### SIDE-EFFECTS

- **Common or very common** Arthralgia · fever · headache · hepatic disorders · hepatitis · jaundice · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
- **Rare** Agranulocytosis · alopecia · bone marrow suppression · hypersensitivity reactions · jaundice · myopathy · pancytopenia

### SIDE-EFFECTS, FURTHER INFORMATION

Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted.

### PREGNANCY

Carbamazole can be given but the blocking-replacement regimen is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate. Carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

- **PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor immediately if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**

- **Carbamazole (Non-proprietary)**
  - Carbimazole 5 mg
  - Carbimazole 5mg tablets | 100 tablet (£84.80 DT price = £62.37)
  - Carbimazole 20 mg
  - Carbimazole 20mg tablets | 100 tablet (£216.00 DT price = £166.71)

ANTITHYROID DRUGS > THIOURACILS

**Propylthiouracil**

### INDICATIONS AND DOSE

#### Hyperthyroidism (including Graves' disease)

- **BY MOUTH**

- Neonate: Initially 2.5–5 mg/kg twice daily until euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.
- Child 1-11 months: Initially 2.5 mg/kg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.
- Child 1-4 years: Initially 25 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.
- Child 5-11 years: Initially 50 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.
- Child 12-17 years: Initially 100 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.

#### DOSE EQUIVALENT AND CONVERSION

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

### IMPORTANT SAFETY INFORMATION

**NEUMOPENIA AND AGRAUNLCYTOSIS**

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.

**Carbamazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.**

### INTERACTIONS

- Appendix 1: propylthiouracil

### SIDE-EFFECTS

- **Common or very common** Arthralgia · fever · headache · hepatic disorders · hepatitis · jaundice · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance

### UNLICENSED USE

Not licensed for use in children under 6 years of age.

### INTERACTIONS

- Appendix 1: propylthiouracil

### SIDE-EFFECTS

- **Common or very common** Arthralgia · fever · headache · jaundice · leucopenia · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
- **Rare** Agranulocytosis · alopecia · aplastic anaemia · bone marrow suppression · cutaneous vasculitis ·
enlarged liver, decreased appetite, nausea, vomiting, yellowing of the skin, jaundice, dark urine, pain in salivary glands, headache, rash, skin thickening, acne, hirsutism, weight gain.

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Hepatotoxicity** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver enzyme abnormalities develop.

- **PREGNANCY** Propylthiouracil can be given but the blocking-replacement regimen is not suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function. Monitor infant’s thyroid status.

- **HEPATIC IMPAIRMENT** Reduce dose.

- **RENAL IMPAIRMENT** Use 75% of normal dose if estimated glomerular filtration rate 10–50 mL/minute/1.73 m². Use 50% of normal dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Monitor for hepatotoxicity.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution Tablet

  - Propylthiouracil (Non-proprietary)

    - Propylthiouracil 50 mg Propylthiouracil 50mg tablets | 56 tablet | £1.44 DT price = £59.47 | 100 tablet | £127.57

**VITAMINS AND TRACE ELEMENTS**

**Iodide with iodine**

- **INDICATIONS AND DOSE**

  - **Thyrotoxicosis (pre-operative)**
    - By mouth using oral solution
    - Neonate: 0.1–0.3 mL 3 times a day.
    - Child: 0.1–0.3 mL 3 times a day
  
  - **Neonatal thyrotoxicosis**
    - By mouth using oral solution
    - Neonate: 0.05–0.1 mL 3 times a day.
  
  - **Thyrotoxic crisis**
    - By mouth using oral solution
    - Child 1 month–1 year: 0.2–0.3 mL 3 times a day

  - **CAUTIONS** Children - not for long-term treatment

  - **SIDE-EFFECTS** Bronchitis - conjunctivitis - coryza-like symptoms - depression (on prolonged treatment) - goitre in infants of mothers taking iodides - headache - hypersensitivity reactions - impotence (on prolonged treatment) - insomnia (on prolonged treatment) - lacrimation - laryngitis - pain in salivary glands - rashes

  - **PREGNANCY** Neonatal goitre and hypothyroidism.

  - **BREAST FEEDING** Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.

  - **DIRECTIONS FOR ADMINISTRATION** For oral solution, dilute well with milk or water.

  - **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

    - Oral solution
      - CAUTIONARY AND ADVISORY LABELS 27
      - Iodide with iodine (Non-proprietary)
      
  - Iodine 50 mg per 1 mL Potassium iodide 100 mg per 1 mL Iodine aqueous oral solution | 500 mL | £9.58

**8.2 Hypothyroidism**

**Thyroid hormones**

**Overview**

Thyroid hormones are used in hypothyroidism (juvenile myxoedema), and also in diffuse non-toxic goitre, congenital or neonatal hypothyroidism, and Hashimoto’s thyroiditis (lymphadenoid goitre). Neonatal hypothyroidism requires prompt treatment to facilitate normal development. Levothyroxine sodium below (thyroxine sodium) is the treatment of choice for maintenance therapy.

Doses for congenital hypothyroidism and juvenile myxoedema should be titrated according to clinical response, growth assessment, and measurement of plasma thyroxine and thyroid-stimulating hormone concentrations. In congenital hypothyroidism higher initial doses may normalise metabolism more quickly, with associated beneficial effects on mental development.

Liothyronine sodium p. 465 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in severe hypothyroid states when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 420, and treatment of infection; assisted ventilation is often required.

**THYROID HORMONES**

**Levothyroxine sodium**

(Thyroxine sodium)

- **INDICATIONS AND DOSE**

  - **Hypothyroidism**
    - By mouth
    - Neonate: Initially 10–15 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 5 micrograms/kg every 2 weeks, alternatively adjusted in steps of 5 micrograms/kg as required; maintenance 20–50 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.

    - Child 1 month–1 year: Initially 5 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 10–25 micrograms every 2–4 weeks until metabolism normalised; maintenance 25–75 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes
before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

- Child 2-11 years: Initially 50 micrograms once daily; adjusted in steps of 25 micrograms every 2–4 weeks until metabolism normalised; maintenance 75–100 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

- Child 12-17 years: Initially 50 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks until metabolism normalised; maintenance 100–200 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

### Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole

- **By mouth**
- Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

#### Cautions

- Cardiac disorders (monitor ECG; start at low dose and carefully titrate) - diabetes insipidus - diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) - long-standing hypothyroidism - panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) - predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

#### Side-effects

- Anginal pain (usually at excessive dosage)
- Arrhythmias (usually at excessive dosage) - benign intracranial hypertension (usually at excessive dosage) - craniosynostosis - diarrhoea (usually at excessive dosage) - eosinophilia - excitability (usually at excessive dosage) - fever - flushing - headache - heat intolerance - hypersensitivity reactions - insomnia (usually at excessive dosage) - liver dysfunction - menstrual irregularities - muscle cramp - muscular weakness - nervousness - oedema - palpitation (usually at excessive dosage) - premature closure of epiphyses - pruritus - rash - restlessness (usually at excessive dosage) - sweating - tachycardia (usually at excessive dosage) - transient hair loss - tremor (usually at excessive dosage) - vomiting (usually at excessive dosage) - weight-loss

#### Pregnancy

Levothyroxine requirement may increase during pregnancy. Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

#### Breast feeding

Amount too small to affect tests for neonatal hypothyroidism.

#### Prescribing and dispensing information

Levothyroxine equivalent to 100 micrograms/m²/day can be used as a guide to the requirements in children.

#### Patient and carer advice

Medicines for Children leaflet: Levothyroxine for hypothyroidism www.medicinesforchildren.org.uk/levothyroxine-for-hypothyroidism

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### Tablet

- **Levothyroxine sodium (Non-proprietary)**
  - Levothyroxine sodium anhydrous 12.5 microgram 
  - Levothyroxine sodium 12.5 microgram tablets [28 tablet (Pom)] £12.75–£15.00 DT price = £14.10
  - Levothyroxine sodium anhydrous 25 microgram 
  - Levothyroxine sodium 25 microgram tablets [28 tablet (Pom)] £4.00 DT price = £2.91
  - Levothyroxine sodium 50 microgram tablets lactose free [100 tablet (Pom) no price available]
  - Levothyroxine sodium anhydrous 50 microgram 
  - Levothyroxine sodium 50 microgram tablets lactose free [100 tablet (Pom) no price available]
  - Levothyroxine sodium anhydrous 100 microgram 
  - Levothyroxine sodium 100 microgram tablets lactose free [100 tablet (Pom) no price available]
  - Levothyroxine sodium 100 microgram tablets [28 tablet (Pom)] £4.75 DT price = £1.66
  - Eltroxin (AMCo)
    - Levothyroxine sodium anhydrous 25 microgram 
    - Eltroxin 25 microgram tablets [28 tablet (Pom)] £2.33 DT price = £2.91
    - Levothyroxine sodium anhydrous 50 microgram 
    - Eltroxin 50 microgram tablets [28 tablet (Pom)] £1.33 DT price = £1.66
    - Levothyroxine sodium anhydrous 100 microgram 
    - Eltroxin 100 microgram tablets [28 tablet (Pom)] £1.33 DT price = £1.66

#### Oral solution

- **Levothyroxine sodium (Non-proprietary)**
  - Levothyroxine sodium anhydrous 5 microgram per 0.025 ml 
  - Levothyroxine sodium 5 microgram per 5 ml oral solution sugar free [100 ml (Pom)] £95.00 DT price = £94.59
  - Levothyroxine sodium anhydrous 10 microgram per 0.05 ml 
  - Levothyroxine sodium 10 microgram per 5 ml oral solution sugar free [100 ml (Pom)] £94.44 DT price = £93.02
  - Levothyroxine sodium anhydrous 20 microgram per 0.1 ml 
  - Levothyroxine sodium 20 microgram per 5 ml oral solution sugar free [100 ml (Pom)] £165.00 DT price = £164.14

#### Capsule

- **Levothyroxine sodium (Non-proprietary)**
  - Levothyroxine sodium anhydrous 25 microgram 
  - Tirosint 25 microgram capsules [28 capsule (Pom)] no price available
  - Levothyroxine sodium anhydrous 50 microgram 
  - Tirosint 50 microgram capsules [28 capsule (Pom)] no price available
  - Levothyroxine sodium anhydrous 100 microgram 
  - Tirosint 100 microgram capsules [28 capsule (Pom)] no price available

### Liothyronine sodium

(L-Tri-iodothyronine sodium)

#### Indications and dose

**Hypothyroidism**

- **By mouth**
- Child 12-17 years: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses

**Hypothyroid coma**

- **By slow intravenous injection**
- Child 12-17 years: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

**Hypothyroidism (replacement for oral levothyroxine)**

- **By slow intravenous injection**
- Child: Convert daily levothyroxine dose to Liothyronine and give in 2–3 divided doses, adjusted according to response

Endocrine system
DOSE EQUIVALENCE AND CONVERSION

- 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

**CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) - diabetes insipidus - diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) - prolonged hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency) - severe hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency)

**INTERACTIONS** → Appendix 1: liothyronine

**SIDE-EFFECTS** Anginal pain (usually at excessive dosage) - arrhythmias (usually at excessive dosage) - diarrhoea (usually at excessive dosage) - excitability (usually at excessive dosage) - flushing - headache - muscle cramp - muscular weakness - palpitation (usually at excessive dosage) - restlessness (usually at excessive dosage) - sweating - tachycardia (usually at excessive dosage) - weight-loss

**PREGNANCY** Liothyronine requirement may increase during pregnancy. Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus. Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

**BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

**Tablet**

- **Liothyronine sodium (Non-proprietary)**
  - Liothyronine sodium 5 microgram Cytomel 5microgram tablets | 100 tablet [Pos] no price available
  - Liothyronine sodium 20 microgram Liothyronine 20microgram tablets | 28 tablet [Pos] £258.20 DT price = £258.20
  - Liothyronine sodium 25 microgram Cytomel 25microgram tablets | 100 tablet [Pos] no price available

**Powder for solution for injection**

- **Liothyronine sodium (Non-proprietary)**
  - Liothyronine sodium 20 microgram Liothyronine 20microgram powder for solution for injection vials | 5 vial [Pos] £1,425.00

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity; oxybutynin hydrochloride p. 468 also has a direct relaxant effect on urinary smooth muscle. Oxybutynin hydrochloride can be considered first for children under 12 years. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose and then slowly titrating upwards; alternatively oxybutynin hydrochloride can be given by intravesicular instillation. Tolterodine tartrate p. 469 is also effective for urinary incontinence; it can be considered for children under 12 years, or for younger children who have failed to respond to oxybutynin hydrochloride. Modified-release preparations of oxybutynin hydrochloride and tolterodine tartrate are available; they may have fewer side-effects. Antimuscarinic treatment should be reviewed soon after it is commenced, and then at regular intervals; a response generally occurs within 6 months but occasionally may take longer. Children with nocturnal enuresis may require specific additional measures if night-time symptoms also need to be controlled.

Nocturnal enuresis in children

23-May-2017

Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

Treatment

Children under 5 years

For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families. (a)

Non Drug Treatment

Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in children under 7 years should be considered depending on the child’s maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks’ uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 412, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable. (a)

Drug Treatment

Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn gradually at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 468 or tolterodine tartrate p. 469 [unlicensed indication]). Treatment should be continued for 3 months; the course can be repeated if necessary.
The tricyclic antidepressant imipramine hydrochloride p. 231 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually.

**Useful Resources**

### ANTIMUSCARINICS

**Antimuscarinics (systemic)**

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction • Intestinal atony • myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) • paralytic ileus • pyloric stenosis • severe ulcerative colitis • significant bladder outflow obstruction • toxic megacolon • urinary retention

- **CAUTIONS** Arrhythmias (may be worsened) • autonomic neuropathy • cardiac insufficiency (due to association with tachycardia) • cardiac surgery (due to association with tachycardia) • children (increased risk of side-effects) • conditions characterised by tachycardia • congestive heart failure (may be worsened) • coronary artery disease (may be worsened) • diarrhoea • gastro-oesophageal reflux disease • hiatus hernia with reflux oesophagitis • hypertensive • hyperthermia (due to association with tachycardia) • individuals susceptible to angle-closure glaucoma • pyrexia • ulcerative colitis

- **SIDE-EFFECTS**
  - Common or very common Constipation • dilation of pupils with loss of accommodation • dry mouth • photophobia • reduced bronchial secretions • skin dryness • skin flushing • transient bradycardia (followed by tachycardia, palpitation and arrhythmias) • urinary retention • urinary urgency
  - Uncommon Confusion • giddiness • nausea • vomiting
  - Very rare Angle-closure glaucoma
  - Frequency not known Angioedema • blurred vision • brurred vision • central nervous system stimulation • convulsion • diarrhoea • difficulty in micturition • disorientation • dizziness • drowsiness • dry eyes • euphoria • fatigue • flatulence • hallucinations • headache • impaired memory • palpitation • photosensitivity • rash • reduced sweating (may lead to heat sensations and fainting in hot environments or patients with fever) • restlessness • taste disturbances

**PATIENT AND CARER ADVICE**

Driving and skilled tasks Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

**Oxybutynin hydrochloride**

- **INDICATIONS AND DOSE**
  - Urinary frequency
  - Urinary urgency
  - Urinary incontinence
  - Neurogenic bladder instability
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Child 2-4 years: 1.25–2.5 mg 2–3 times a day
      - Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
      - Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day

- **BY INTRAVESICAL INSTILLATION**
  - Child 2–17 years: 5 mg 2–3 times a day
  - BY MOUTH USING MODIFIED-RELEASE TABLETS
    - Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

- **Nocturnal enuresis associated with overactive bladder**
  - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
    - Child 5–17 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime
  - BY MOUTH USING MODIFIED-RELEASE TABLETS
    - Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

- **DOSE EQUIVALENCE AND CONVERSION**
  - Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of Lyrinel XL

- **UNLICENSED USE** Not licensed for use in children under 5 years. Intravesical instillation not licensed for use in children.

- **CAUTIONS** Acute porphyrias p. 577

- **INTERACTIONS** → Appendix 1: oxybutynin

- **SIDE-EFFECTS**
  - Uncommon Anorexia • facial flushing
  - Rare Night terrors

- **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in animal studies.

- **BREAST FEEDING** Manufacturers advise avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

- **PRESCRIBING AND DISPENSING INFORMATION** The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

  Intravesical instillation may be available from special-order manufacturers or specialist importing companies.

**Tolterodine tartrate**

**INDICATIONS AND DOSE**

**Urinary frequency**  |  **Urinary urgency**  |  **Urinary incontinence**
---|---|---
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 2-17 years: 1 mg once daily, then increased if necessary up to 2 mg twice daily, adjusted according to response
  - **BY MOUTH USING MODIFIED-RELEASE CAPSULES**
  - Child 2-17 years: 4 mg once daily

**Nocturnal enuresis associated with overactive bladder**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 5-17 years: 1 mg once daily, dose to be taken at bedtime, then increased if necessary up to 2 mg twice daily, adjusted according to response

**DOSE EQUIVALENCE AND CONVERSION**
- Children stabilised on immediate-release tolterodine tartrate 2 mg twice daily may be transferred to modified-release tolterodine tartrate 4 mg once daily.

**UNLICENSED USE**  Not licensed for use in children.

**CAUTIONS**  History of QT-interval prolongation

**INTERACTIONS**  Appendix 1: tolterodine

**SIDE-EFFECTS**
- **Common or very common** Bronchitis  •  chest pain  •  fatigue  •  paraesthesia  •  peripheral oedema  •  sinusitis  •  vertigo  •  weight gain
- **Uncommon**  Memory impairment
- **Frequency not known**  Flushing

**PREGNANCY**  Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**  Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**  Reduce dose. Avoid modified-release preparations.

**RENAL IMPAIRMENT**  Reduce dose if estimated glomerular filtration less than 30 mL/minute/1.73m². Avoid modified-release preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73m².

**PRESCRIBING AND DISPENSING INFORMATION**  The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

---

**1.2 Urinary retention**

**Description of condition**

Urinary retention is the inability to voluntarily urinate. Causes in children can include severe voiding dysfunction, urethral blockage, drug treatment (such as opioids and antimuscarinic drugs), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, and neurogenic causes.

Acute urinary retention is a medical emergency characterised by the abrupt (over a period of hours) development of the inability to pass urine, associated with increasing pain and the presence of a distended bladder, which can be palpated on examination.

Chronic urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by difficulties with initiating and maintaining urinary stream, urinary overflow, no sensation for needing to void and a post-void residual.

**Treatment**

Treatment of urinary retention depends on the underlying condition. Catheterisation is used as an effective initial management strategy, which should be followed by diagnostic evaluation and appropriate treatment of the underlying cause. Clean intermittent catheterisation on a long-term basis is effective for children with idiopathic or neurogenic bladder dysfunction.

The selective alpha-adrenoceptor blockers, doxazosin p. 470 and tamsulosin hydrochloride p. 470, have been shown to be of use in primary bladder neck dysfunction and dysfunctional voiding; they reduce urethral sphincteric pressure, thereby improving bladder emptying in children. Treatment should be under specialist advice only.
**ALPHA-ADRENOCEPTOR BLOCKERS**

### Doxazosin

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - By mouth using immediate-release medicines
    - Child 4–11 years: Initially 0.5 mg daily, adjusted according to response, dose should be increased at monthly intervals; maximum 2 mg per day
    - Child 12–17 years: Initially 1 mg daily, adjusted according to response, dose may be doubled at intervals of 1 month; usual maintenance 2–4 mg daily; maximum 8 mg per day
  - **Dysfunctional voiding (initiated under specialist supervision)**
    - By mouth using immediate-release medicines
    - Child 4–11 years: Initially 0.5 mg daily, adjusted according to response, dose should be increased at intervals of 1 week
    - Child 12–17 years: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily, rarely doses of up to 16 mg daily may be required

- **DOSE EQUIVALENCE AND CONVERSION**
  - Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS**
  - History of postural hypotension
- **CAUTIONS**
  - Care with initial dose (postural hypotension) • cataract surgery (risk of intra-operative floppy iris syndrome) • heart failure • pulmonary oedema due to aortic or mitral stenosis
- **INTERACTIONS**
  - Common or very common
    - Anxiety • back pain • coughing • dizziness • fatigue • influenza-like symptoms • myalgia • paraesthesia • sleep disturbance • vertigo
  - Uncommon
    - Agitation • angina • arthralgia • epistaxis • gout • hypoaesthesia • impotence • micturition disturbance • myocardial infarction • purpura • tinnitus • tremor • weight changes
  - Very rare
    - Abnormal ejaculation • alopecia • arrhythmias • bradycardia • bronchospasm • cholestasis • gynaecomastia • hepatitis • hot flushes • jaundice • leucopenia • thrombocytopenia
  - Frequency not known
    - Asthenia • blurred vision • depression • dizziness • gastro-intestinal disturbances • headache • hypersensitivity • hypotension • oedema • palpitations • postural hypotension • priapism • pruritus • rash • rhinitis • syncope • tachycardia
- **PREGNANCY**
  - No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING**
  - Accumulates in milk in animal studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT**
  - Use with caution. Manufacturer advises avoid in severe impairment—no information available.
- **PATIENT AND CARER ADVICE**
  - Patient counselling is advised for doxazosin tablets (initial dose).
  - Driving and skilled tasks
  - May affect performance of skilled tasks e.g. driving.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### Tablet

  - Doxazosin (as Doxazosin mesilate) 4 mg Doxadura 4mg tablets | 28 tablet | £0.73 DT price = £0.84

### Tamsulosin hydrochloride

- **INDICATIONS AND DOSE**
  - Dysfunctional voiding (administered on expert advice)
    - Child 12–17 years: 400 micrograms once daily

- **UNLICENSED USE**
  - Not licensed for use in children.
- **CONTRA-INDICATIONS**
  - History of postural hypotension
- **CAUTIONS**
  - Care with initial dose (postural hypotension) • cataract surgery (risk of intra-operative floppy iris syndrome)
- **INTERACTIONS**
  - Abnormal ejaculation • angioedema • asthenia • blurred vision • constipation • diarrhoea • dizziness • drowsiness • dry mouth • headache • hypersensitivity reactions • hypotension (notably postural hypotension) • intra-operative floppy iris syndrome • nausea • oedema • palpitations • priapism • pruritus • rash • rhinitis • syncope • urticaria • vomiting
- **HEPATIC IMPAIRMENT**
  - Avoid in severe impairment.
- **RENAL IMPAIRMENT**
  - Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - May affect performance of skilled tasks e.g. driving.

1.3 Urological pain

Urological pain

Treatment

Lidocaine hydrochloride gel p. 796 is a useful topical application in urethral pain or to relieve the discomfort of catheterisation.

Alkalisation of urine

Alkalisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of cystitis caused by lower urinary tract infections.

ALKALISING DRUGS

Citric acid with potassium citrate

- INDICATIONS AND DOSE
- Relief of discomfort in mild urinary-tract infections | Alkalisation of urine
- BY MOUTH USING ORAL SOLUTION
- Child 1–5 years: 5 mL 3 times a day, diluted well with water
- Child 6–17 years: 10 mL 3 times a day, diluted well with water

- CAUTIONS
- Cardiac disease

- INTERACTIONS
- Appendix 1: potassium citrate

- SIDE-EFFECTS
- Hyperkalaemia on prolonged high dosage - mild diuresis

- REPRODUCTIVE IMPAIRMENT
- Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

- PRESCRIBING AND DISPENSING INFORMATION
- When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K+/10 mL.

- EXCEPTIONS TO LEGAL CATEGORY
- Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary tract infections.

- MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Oral solution  

CAUTIONARY AND ADVISORY LABELS. 27

- Citric acid with potassium citrate (Non-proprietary)
- Citric acid monohydrate 50 mg per 1 mL Potassium citrate 300 mg per 1 mL Potassium citrate mixture | 200 mL (P)  £1.33 DT price = £1.33

2 Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts. Aqueous chlorhexidine p. 673 can be used in the management of common infections of the bladder but it is ineffective against most Pseudomonas spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% (physiological saline) p. 561 is usually adequate and is preferred as a mechanical irrigant.

Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

Catheter maintenance solutions

- CATHETER MAINTENANCE SOLUTIONS
- OptiFlo 8% citric acid 6% catheter maintenance solution (Bard Ltd) 50 mL · NHS indicative price = £3.60 · Drug Tariff (Part IXa) 100 mL · NHS indicative price = £3.60 · Drug Tariff (Part IXa)
3 Contraception

Contraceptives, hormonal

Overview

The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg16) should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a spermicide. Occasionally sensitivity reactions occur. A female condom (Femidom®) is also available; it is pre-lubricated but does not contain a spermicide.

Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen (‘combined oral contraceptives’) are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed ‘monophasic’; those with varying amounts of the two hormones are termed ‘phasic’. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Choice

The majority of combined oral contraceptives contain ethinylestradiol as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- **Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- **Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram phased preparations) are appropriate for standard use. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 478, ethinylestradiol with drospirenone p. 479, and ethinylestradiol with gestodene p. 480 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 478 is in the combined oral contraceptive Qlaira®. Nomegestrol is the progestogen contained in the combined oral contraceptive Zoely®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (Eva®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (NuvaRing®).

Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

**Reason to stop immediately**

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.
Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) p. 489 is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (Noristerat®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An etonogestrel-releasing implant (Nexplanon®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems Mirena®, Jaydess® and Levonorgestrel are licensed for contraception, and Levovist® is additionally licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Emergency contraception

Hormonal methods

Hormonal emergency contraceptives include levonorgestrel and ulipristal acetate p. 484; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate, a progestosterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device. Ulipristal acetate is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin p. 314). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

Contraceptives, interactions 06-Jun-2017

Overview

The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 189, eslicarbazepine acetate, nevirapine p. 395, ocarbazepine p. 197, phenytoin p. 198, phenobarbital p. 208,
and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug.

**Parenteral progestogen-only contraceptives interactions**

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. Effectiveness of the levonorgestrel-releasing implant p. 489 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug.

**Hormonal emergency contraception interactions**

The effectiveness of levonorgestrel and ulipristal acetate p. 484 is reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See Dose adjustments due to interactions under levonorgestrel). There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

The effectiveness of ulipristal acetate for emergency contraception may be reduced by drugs that increase gastric pH (such as regular use of antacids, H₂ receptor antagonists and proton pump inhibitors). Levonorgestrel or a copper intra-uterine device should be considered as alternatives.

Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception, as the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended. Ulipristal acetate can be used as emergency hormonal contraception more than once in the same cycle. Conversely, manufacturer advises that use of levonorgestrel as emergency contraception more than once in the same cycle is not advisable due to increased risk of side-effects (such as menstrual irregularities).

Ulipristal acetate should not be used (as emergency hormonal contraception) within 5 days of administration of ulipristal acetate (as emergency hormonal contraception), as the contraceptive effect of ulipristal acetate may be reduced by progestogens.

Ulipristal acetate is not recommended for use in women who have severe asthma treated by oral corticosteroids, due to the antiglucocorticoid effect of ulipristal acetate.

**Useful Resources**

Contraceptives, non-hormonal

Spermicidal contraceptives
Spermicidal contraceptives are useful additional safeguards but do not give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol 9 p. 490 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Contraceptive devices
Intra-uterine devices
The intra-uterine device (IUD) is a suitable contraceptive for young women irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

A frameless, copper-bearing intra-uterine device (Gyne Fix®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

Caution with oil-based lubricants
Products such as petroleum jelly (Vaseline®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

3.1 Contraception, combined

OESTROGENS COMBINED WITH PROGESTOGENS

Combined hormonal contraceptives

- CONTRA-INDICATIONS Acute porphyrias p. 577 • gallstones • heart disease associated with pulmonary hypertension or risk of embolus • history during pregnancy of cholestatic jaundice • history during pregnancy of chorea • history during pregnancy of pemphigoid gestationis • history during pregnancy of pruritus • history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) • history of haemolytic uraemic syndrome • migraine with aura • personal history of venous or arterial thrombosis • scleroderma • severe or multiple risk factors for arterial disease • severe or multiple risk factors for venous thromboembolism • systemic lupus erythematosus • transient cerebral ischaemic attacks without headaches • undiagnosed vaginal bleeding

- CAUTIONS Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • Crohn’s disease • gene mutations associated with breast cancer (e.g. BRCA 1) • history of severe depression especially if induced by hormonal contraceptive • hyperprolactinaemia (seek specialist advice) • inflammatory bowel disease • migraine • personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) • risk factors for arterial disease • risk factors for venous thromboembolism • sickle-cell disease • undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION
- Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

- Risk factors for venous thromboembolism Use with caution if any of following factors present but avoid if two or more factors present:
  - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - obesity; body mass index $\geq 30$ kg/m² (avoid if body mass index $\geq 35$ kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
  - history of superficial thrombophlebitis;
  - age over 35 years (avoid if over 50 years);
  - smoking.

<sup>1</sup>Combined with ethinylestradiol  <sup>2</sup>Combined with estradiol

### Risk factors for arterial disease
- Use with caution if any one of the following factors present but avoid if two or more factors present:
  - Family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
  - Diabetes mellitus (avoid if diabetes complications present);
  - Hypertension; blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (in adolescents, avoid if blood pressure very high);
  - Smoking (avoid if smoking 40 or more cigarettes daily);
  - Age over 35 years (avoid if over 50 years);
  - Obesity (avoid if body mass index ≥ 35 kg/m<sup>2</sup> unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - Migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- Migraine
  - Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

### INTERACTIONS
- Appendix 1 combined hormonal contraceptives.

### SIDE-EFFECTS
- Rare Gallstones · systemic lupus erythematosus
- Frequency not known Abdominal cramps · absence of withdrawal bleeding · amenorrhoea after discontinuation · breast enlargement · breast secretion · breast tenderness · cervical erosion · changes in libido · changes in lipid metabolism · changes in vaginal discharge · chloasma · chorea · contact lenses may irritate · depression · fluid retention · headache · hepatic tumours · hypertension · irritability · leg cramps · liver impairment · nausea · nervousness · photosensitivity · reduced menstrual loss · skin reactions · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) · visual disturbances · vomiting · ‘spotting’ in early cycles

### SIDE-EFFECTS, FURTHER INFORMATION
- Breast cancer
  - There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by about 10 years.
  - Cervical cancer
  - Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years.

The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

### PREGNANCY
- Not known to be harmful.

### BREAST FEEDING
- Avoid until weaning or for 6 months after birth (adverse effects on lactation).

### HEPATIC IMPAIRMENT
- Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.

### DIRECTIONS FOR ADMINISTRATION
- With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. 21-day combined preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle— if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. Every day (ED) combined preparations, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle— if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Changing to combined preparation containing different progestogen
- If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations. Changing from progestogen-only tablet
- If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for Qlaira<sup>®</sup>).

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira<sup>®</sup>).

After abortion or miscarriage
- Start same day.

### PATIENT AND CARER ADVICE
- Missed pill
  - The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval).
  - If a woman forgets to take a pill, it should be taken as...
soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets).

Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Travel Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hose.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occur during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

Ethinylestradiol with drosiprenone

**INDICATIONS AND DOSE**

**Contraception | Menstrual symptoms**

- **BY VAGINA**
- **Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)**

**DIRECTIONS FOR ADMINISTRATION**

Changing method of contraception to vaginal ring Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle. Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer vaginal ring. Counselling The presence of the ring should be checked regularly. Missed doses Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for less than 3 hours,
rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Vaginal delivery system**

- Ethinylestradiol with etonogestrel (Non-proprietary)
  Ethinylestradiol 2.7 mg, Etonogestrel 11.7 mg Ethinylestradiol 2.7mg / Etonogestrel 11.7mg vaginal delivery system

  - Rigividon (Conscient Health Ltd)
  - Ethinylestradiol 30 microgram, Levonorgestrel
  - 150 microgram Rigividon tablets | 63 tablet | £1.89 DT price = £2.82

- **INDICATIONS AND DOSE**
  - **Contraception** | Menstrual symptoms
  - **BY TRANSDERMAL APPLICATION**
  - Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

- **UNLICENSED USE** Consult product literature for the licensing status of individual preparations.

- **DIRECTIONS FOR ADMINISTRATION** Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.

- Changing to a transdermal combined hormonal contraceptive
  - Changing from combined oral contraception
    - Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch.
    - Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.
  
  - Changing from progestogen-only method
    - from an implant, apply first patch on the day implant removed
    - from an injection, apply first patch when next injection due
    - from oral progestogen, first patch may be applied on any day after stopping pill

- For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

  - After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

  - After abortion or miscarriage
    - Before 20 weeks’ gestation start immediately; no additional contraception required if started immediately. After 20 weeks’ gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

- **PATIENT AND CARER ADVICE**
  - Patients and carers should be given advice on how to administer patches.

  - Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

- **Missed doses**
  - **Delayed application or detached patch** If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual ‘change day’. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

  - If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of
contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):
- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

**National Funding/Access Decisions**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2003) that *Evra*® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

3.2 Contraception, devices

Other drugs used for Contraceptive devices
Levonorgestrel, p. 486

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper)

- INDICATIONS AND DOSE
  - Contraception
    - BY INTRA-UTERINE ADMINISTRATION
    - Females of childbearing potential: (consult product literature)

  IMPORTANT SAFETY INFORMATION
  MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS
  Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in women who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:
  - severe pelvic pain after insertion (worse than period cramps);
  - pain or increased bleeding after insertion which continues for more than a few weeks;
  - sudden changes in periods;
  - pain during intercourse;
  - unable to feel the threads.
  Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

- CONTRA-INDICATIONS
  - Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration);
  - distorted uterus cavity established or marked immunosuppression;
  - genital malignancy;
  - medical diathesis;
  - pelvic inflammatory disease;
  - recent sexually transmitted infection (if not fully investigated and treated);
  - severe anaemia;
  - small uterus cavity;
  - unexplained uterine bleeding;
  - Wilson's disease

- CAUTIONS
  - Anaemia;
  - anticoagulant therapy (avoid if possible);
  - diabetes;
  - disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression);
  - drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression);
  - endometriosis;
  - epilepsy (risk of seizure at time of insertion);
  - fertility problems;
  - history of pelvic inflammatory disease;
  - increased risk of expulsion if inserted before uterine involution;
  - menorrhagia (progestogen intra-uterine system might be preferable);
  - nulliparity;
  - severe cervical stenosis;
  - severe primary dysmenorrhea;
  - severely scarred uterus (including after endometrial resection);
  - young age

CAUTIONS, FURTHER INFORMATION
An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- Risk of infection
  - The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
    - they are under 25 years old
    - they are over 25 years old and have a new partner or have had more than one partner in the past year
    - their regular partner has other partners.
  - In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

- SIDE-EFFECTS
  - Allergy—bleeding (on insertion);
  - cervical perforation—displacement—dysmenorrhoea—expulsion—menorrhagia—occasionally epileptic seizure (on insertion);
  - pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion);
  - pelvic infection may be exacerbated—uterine perforation—vasovagal attack (on insertion)

SIDE-EFFECTS, FURTHER INFORMATION
- Presence of significant symptoms (especially pain)
  - Advise the patient to seek medical attention promptly in case of significant symptoms.

- ALLERGY AND CROSS-SENSITIVITY
  - Contra-indicated if the patient has a copper allergy.

- PREGNANCY
  - If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.

- BREAST FEEDING
  - Not known to be harmful.

- MONITORING REQUIREMENTS
  - Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.

- DIRECTIONS FOR ADMINISTRATION
  - The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

- PRESCRIBING AND DISPENSING INFORMATION
  - UT380 STANDARD®: For uterine length 6.5–9 cm; replacement every 5 years.
  - NOVAPLUS T 380® AG "Mini" size for minimum uterine length 5 cm; "Normal" size for uterine length 6.5–9 cm; replacement every 5 years.
  - GYNEFIX®: Suitable for all uterine sizes; replacement every 5 years.
  - UT380 SHORT®: For uterine length 5–7 cm; replacement every 5 years.
  - NOVA-T® 380: For uterine length 6.5–9 cm; replacement every 5 years.
  - FLEXI-T® 380: For uterine length over 6 cm; replacement every 5 years.
Uncontrolled severe asthma

For uterine length over 1 cm; for minimum uterine length → For uterine length

Repeated use as an emergency device

INTERACTIONS

PROGESTOGENS

Desogestrel

INDICATIONS AND DOSE

Contraception

Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a ‘missed pill’

UNLICENSED USE Consult product literature for the licensing status of individual preparations.

CONTRA-INDICATIONS Acute porphyrias p. 577 - history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

CAUTIONS Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) — seek specialist advice - arterial disease - functional ovarian cysts - history of jaundice in pregnancy - malabsorption syndromes - past ectopic pregnancy - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

CAUTIONS, FURTHER INFORMATION

Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

INTERACTIONS desogestrel

SIDE-EFFECTS Breast discomfort - changes in libido - depression - disturbance of appetite - dizziness - headache - menstrual irregularities - nausea - skin disorders - vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

PREGNANCY Not known to be harmful.

BREAST FEEDING Progestogen-only contraceptives do not affect lactation.

HEPATIC IMPAIRMENT Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

PATIENT AND CARER ADVICE

Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Missed doses

The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days’.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2003) that Cerazette® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.
Levonorgestrel

18-Feb-2016

- INDICATIONS AND DOSE

Emergency contraception
  - BY MOUTH
    - Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours

Contraception
  - BY MOUTH
    - Females of childbearing potential: 1 tablet daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’

JAYDESS ® 13.5MG INTRA-UTERINE DEVICE

Contraception
  - BY VAGINA
    - Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery; effective for 3 years

LEVOSERT ® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia
  - BY INTRA-UTERINE ADMINISTRATION
    - Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester abortion; postpartum insertions should be delayed until at least 6 weeks after delivery; effective for 3 years

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia
  - BY INTRA-UTERINE ADMINISTRATION
    - Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy
  - BY INTRA-UTERINE ADMINISTRATION
    - Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

DOSE ADJUSTMENTS DUE TO INTERACTIONS

When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs. There is no need to increase the dose for emergency contraception if the patient is taking antibiotics that are not enzyme inducers. With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

- UNLICENSED USE
  - With oral use Consult product literature for licensing status of individual preparations.
  - With vaginal use Not licensed for use in women under 18 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:
  - severe pelvic pain after insertion (worse than period cramps);
  - pain or increased bleeding after insertion which continues for more than a few weeks;
  - sudden changes in periods;
  - pain during intercourse;
  - unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen;
CONTRA-INDICATIONS
- With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration).
- With intra-uterine use Breast cancer.
- With oral use Active porphyrias p. 577.

CAUTIONS
- With intra-uterine use Disease-induced immunosuppression.
- With oral use for contraception History of breast cancer.

SIDE-EFFECTS
- Common or very common Depression (sometimes severe).
- Frequency not known Vomiting.

SPECIFIC SIDE-EFFECTS
- Common or very common Abdominal distension.
- Rare Rash.
- Frequency not known Functional ovarian cysts.

SIDE-EFFECTS, FURTHER INFORMATION
- Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.
- Breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. The main excess risk is associated with the first 20 days after insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent.

PREGNANCY
- With oral use Not known to be harmful.
- With vaginal use If an intra-uterine device fails and the woman wishes to continue to use contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.
progestogen-only contraceptives do not affect lactation.

**Hepatic Impairment** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

**Monitoring Requirements**
- With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

**Directions for Administration**
- With intra-uterine use The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

**Prescribing and Dispensing Information**
- With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

**Mirena® 20 Micrograms/24 Hours Intra-Uterine Device** When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

**Jaydess® 13.5 mg Intra-Uterine Device** When system is removed (and not immediately replaced) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

**Levonelle® One Step** Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

**Patient and Carer Advice**
Diarrhoea and vomiting with use as an oral contraceptive

Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

**Missed doses**
When used as an oral contraceptive, the following advice is recommended ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days’.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

**Starting routine**
- With oral use for Contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

- With intra-uterine use Counsel women to seek medical attention promptly in case of significant symptoms, especially pain. Patient counselling advised. Patient information leaflet to be provided.
- With oral use for Emergency contraception If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given.
- With oral use for Emergency contraception When prescribing or supplying hormonal emergency contraception, women should be advised:
  - that their next period may be early or late;
  - that a barrier method of contraception needs to be used until the next period;
  - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
  - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

**Exceptions to Legal Category** Levonelle® One Step can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

Norethisterone, p. 458

PROGESTOGENS

Etonogestrel

27-Sep-2016

• INDICATIONS AND DOSE

Contraception (no hormonal contraceptive use in previous month)
  ▶ BY SUBDERMAL IMPLANTATION
  • Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)
  ▶ BY SUBDERMAL IMPLANTATION
  • Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery (delay until 28 days postpartum if breast-feeding), implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester
  ▶ BY SUBDERMAL IMPLANTATION
  • Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the first trimester
  ▶ BY SUBDERMAL IMPLANTATION
  • Females of childbearing potential: 1 implant to be inserted within 5 days after abortion or miscarriage, implant should be removed within 3 years of insertion

Contraception (changing from other hormonal contraceptive)
  ▶ BY SUBDERMAL IMPLANTATION
  • Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

• UNLICENSED USE Nexplanon® not licensed for use in females outside of the age range 18–40 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2016): NEXPLANON® (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: REPORTS OF DEVICE IN VASCULATURE AND LUNG

There have been rare reports of Nexplanon® implants reaching the lung via the pulmonary artery. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Correct subdermal insertion reduces the risk of these events.

• CONTRA-INDICATIONS Acute porphyria • history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable • severe arterial disease • undiagnosed vaginal bleeding

• CAUTIONS Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) — seek specialist advice • arterial disease • disturbances of lipid metabolism • history during pregnancy of deterioration of otosclerosis • history during pregnancy of pruritus • history of jaundice in pregnancy • malabsorption syndromes • possible risk of breast cancer • sex-steroid dependent cancer • systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

• INTERACTIONS → Appendix 1: etonogestrel

• SIDE-EFFECTS Breast discomfort • changes in libido • depression • disturbance of appetite • dizziness • headache • injection-site reactions • menstrual irregularities • nausea • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

• Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

• Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

• PREGNANCY Not known to be harmful, remove implant if pregnancy occurs.

• BREAST FEEDING Progestogen-only contraceptives do not affect lactation.

• DIRECTIONS FOR ADMINISTRATION The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

• PATIENT AND CARER ADVICE Full counselling backed by patient information leaflet required before administration.

Medroxyprogesterone acetate

24-May-2017

• INDICATIONS AND DOSE

Contraception
  ▶ BY DEEP INTRAMUSCULAR INJECTION
  • Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
  ▶ BY SUBCUTANEOUS INJECTION
  • Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Long-term contraception
  ▶ BY DEEP INTRAMUSCULAR INJECTION
  • Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
Females of childbearing potential:
No evidence of harm to present in milk
Genital lesions
Acute porphyrias

History during pregnancy in disturbances of hepatic impairment
BREAST FEEDING
PREGNANCY
CONCEPTION AND CONTRACEPTION

SIDE-EFFECTS
Rare Osteoporosis - osteoporotic fractures
Frequency not known Breast discomfort - changes in libido - depression - Disturbance of appetite - dizziness - headache - indigestion - injection site reactions - loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions) - menstrual irregularities - nausea - reduced bone mineral density - skin disorders - vomiting - weight gain

SIDE-EFFECTS, FURTHER INFORMATION
Reduction in bone mineral density occurs in the first 2-3 years of use then stabilises.
Cervical cancer Use of injectable progestogen only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen only contraceptives is not yet known.

CONCEPTION AND CONTRACEPTION
With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.
PREGNANCY Not known to be harmful.
PREGNANCY Not known to be harmful.

3.6 Contraception, spermicidal
Spermicidals

Nonoxinol
INDICATIONS AND DOSE
Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps
BY VAGINA
Females of childbearing potential: (consult product literature)
SIDE-EFFECTS Genital lesions
SIDE-EFFECTS, FURTHER INFORMATION
High frequency use of the spermicide nonoxinol 9 has been associated with genital lesions, which may increase the risk of acquiring these infections.
CONCEPTION AND CONTRACEPTION No evidence of harm to latex condoms and diaphragms.
PREGNANCY Toxicity in animal studies.
BREAST FEEDING Present in milk in animal studies.

4 Vaginal and vulval conditions

Vaginal and vulval conditions
Management
Pre-pubertal girls may be particularly susceptible to vulvovaginitis. Barrier preparations applied after cleansing can be useful when the symptoms are due to non-specific irritation, but systemic drugs are required in the treatment of bacterial infection or threadworm infestation. Intravaginal preparations, particularly those that require the use of an applicator, are not generally suitable for young girls; topical preparations may be useful in some adolescent girls.
In older girls symptoms are often restricted to the vulva, but infections almost invariably involve the vagina, which should also be treated; treatment should be as for adults.
Preparations for vaginal and vulval changes

Topical oestrogen creams containing estriol 0.01% (Gynest®) are used in the treatment of labial adhesions; treatment is usually restricted to symptomatic cases. Estriol cream should be applied to the adhesions once or twice daily for 2–6 weeks; adhesions may recur following treatment.

Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Vaginal fungal infections are not normally a problem in younger girls but can occur in adolescents. Candidal vulvitis can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. Vaginal candidiasis, rare in girls before puberty, can be treated with antifungal pessaries or cream inserted high into the vagina (including during menstruation), however, these are not recommended for pre-pubertal girls and treatment with an external cream may be more appropriate. Single-dose intravaginal preparations offer an advantage when compliance is a problem. Local irritation can occur on application of vaginal antifungal products.

Imidazole drugs ( clotrimazole p. 492, econazole nitrate p. 492, fenticonazole nitrate p. 493, and miconazole p. 493) are effective against candida in short courses of 1 to 3 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 358 may be considered for girls post-puberty.

Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited absorption of imidazoles from the skin and vagina. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrent vulvovaginal candidiasis is very rare in children, but can occur if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus, or obesity. It may also be associated with gynaecological operations and trauma. Recurrent vulvovaginal candidiasis is frequently associated with the gastrointestinal tract and the bladder. The sexual partner may also be the source of reinfection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 319 or tinidazole p. 320. Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially Bacteroides spp. and can be used prophylactically in gynaecological surgery. Clindamycin cream, below, and metronidazole gel, below, are indicated for bacterial vaginosis.

The antiviral drugs aciclovir p. 387 and valaciclovir p. 389 can be used in the treatment of genital infection due to herpes simplex virus, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

4.1 Vaginal and vulval infections

4.1a Vaginal and vulval bacterial infections

ANTIBACTERIALS › LINCOSAMIDES

Clindamycin

- INDICATIONS AND DOSE
  - DALACIN® 2% CREAM
    - Bacterial vaginosis
      - BY VAGINA
      - Child: 1 applicatorful daily for 3–7 nights, dose to be administered at night
  - DOSE EQUIVALENCE AND CONVERSION
    - 1 applicatorful delivers a 5 g dose of clindamycin 2%.

- UNLICENSED USE
  - Not licensed for use in children.

- CAUTIONS
  - Avoid intravaginal preparations (particularly those that require the use of an applicator) in young girls who are not sexually active, unless there is no alternative

- SIDE-EFFECTS
  - Cervicitis - irritation - vaginitis

- SIDE-EFFECTS, FURTHER INFORMATION
  - Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

- CONCEPTION AND CONTRACEPTION
  - Damages latex condoms and diaphragms.

ANTIBACTERIALS › NITROIMIDAZOLE DERIVATIVES

Metronidazole

- DRUG ACTION
  - Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

- INDICATIONS AND DOSE
  - Bacterial vaginosis
    - BY VAGINA USING VAGINAL GEL
      - Child: 1 applicatorful daily for 5 days, dose to be administered at night
  - DOSE EQUIVALENCE AND CONVERSION
    - 1 applicatorful delivers a 5 g dose of metronidazole 0.75%

- UNLICENSED USE
  - Metronidazole vaginal gel not licensed for use in children under 18 years.

- CAUTIONS
  - Avoid intravaginal preparations (particularly those that require the use of an applicator) in young girls who are not sexually active, unless there is no alternative - not recommended during menstruation - some systemic absorption may occur with vaginal gel

- INTERACTIONS
  - Appendix 1: metronidazole
Recurrent vulvovaginal candidiasis
- **BY VAGINA USING PESSARIES**
  - Child: 500 mg every week for 6 months, dose to be administered following topical imidazole for 10–14 days

- **UNLICENSED USE**
  - Consult product literature for individual preparations.

- **CAUTIONS**
  - Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative

- **INTERACTIONS**
  - Appendix 1: antifungals, azoles

- **SIDE-EFFECTS**
  - Local irritation

- **CONCEPTION AND CONTRACEPTION**
  - Cream and pessaries may damage latex condoms and diaphragms.

- **PREGNANCY**
  - Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - Brands for sale to the public include Canesten® Internal Cream.

## CARBOXYLIC ACIDS

### Lactic acid

#### INDICATIONS AND DOSE

**BALANCE ACTIV RX® GEL**

**Prevention of bacterial vaginosis**
- **BY VAGINA**
- **Child**: 5 mL 1–2 times a week, insert the content of 1 tube (5 mL)

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Vaginal gel**

- **EXCIPIENTS**: May contain Disodium edetate, hydroxybenzoates (parabens), propylene glycol
- **Metronidazole (Non-proprietary)**
  - Metronidazole 7.5 mg per 1 gram Metronidazole 0.75% vaginal gel | 40 gram (Pos) no price available DT price = £4.31
- **Zidovol** (Meda Pharmaceuticals Ltd)
  - Metronidazole 7.5 mg per 1 gram Zidovol 0.75% vaginal gel | 40 gram (Pos) £4.31 DT price = £4.31

### 4.1b Vaginal and vulval fungal infections

Other drugs used for Vaginal and vulval fungal infections
Fluconazole, p. 358

**ANTIFUNGALS** > **IMIDAZOLE ANTIFUNGALS**

#### Clotrimazole

#### INDICATIONS AND DOSE

**Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)**
- **BY VAGINA USING CREAM**
- **Child**: Apply 2–3 times a day, to be applied to anogenital area

**Vaginal candidiasis (dose for 10% intravaginal cream)**
- **BY VAGINA USING PESSARIES**
- **Child**: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary

**Vaginal candidiasis**
- **BY VAGINA USING PESSARIES**
- **Child**: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Vaginal gel**

- **EXCIPIENTS**: May contain Propylene glycol
- **Balance Activ** (BBI Healthcare Ltd)
  - Balance Activ BV vaginal pH correction gel | 5 mL | £2.55

**Cream**

- **EXCIPIENTS**: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
- **Clotrimazole (Non-proprietary)**
  - Clotrimazole 100 mg Clotrimazole 100 mg pessaries | 1 pessary £3.75 DT price = £2.88
  - Clotrimazole 200 mg Clotrimazole 200 mg pessaries | 3 pessaries £3.10 DT price = £3.10
  - Clotrimazole 500 mg Clotrimazole 500 mg Soft Gel pessaries | 1 pessary £6.41 DT price = £2.88
  - Clotrimazole 500 mg Clotrimazole 500 mg pessaries | 1 pessary no price available DT price = £2.88
  - Clotrimazole 500 mg Clotrimazole 500 mg vaginal gel | 6 pessaries £6.41 DT price = £2.88

**Internal Cream**

- **EXCIPIENTS**: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
- **Clotrimazole (Non-proprietary)**
  - Clotrimazole 10 mg Clotrimazole 10 mg pessaries | 1 pessary £3.75 DT price = £2.88
  - Clotrimazole 50 mg Clotrimazole 50 mg pessaries | 5 pessaries £3.50 DT price = £3.50
  - Clotrimazole 100 mg Clotrimazole 100 mg pessaries | 10 pessaries £6.41 DT price = £3.10

**Econazole nitate**

#### INDICATIONS AND DOSE

**GYNO-PEVARYL® ONCE**

**Vaginal and vulval candidiasis**
- **BY VAGINA**
  - **Child**: 1 pessary for 1 dose, pessary to be inserted at night, dose to be repeated once if necessary

**GYNO-PEVARYL® PESSARY**

**Vaginal and vulval candidiasis**
- **BY VAGINA**
  - **Child**: 1 pessary daily for 3 days, pessary to be inserted at night, course can be repeated once if necessary
**INDICATIONS AND DOSE**

**Vaginal and vulval candidiasis**
- **BY VAGINA USING CAPSULES**
  - Child: 200 mg daily for 3 days, alternatively 600 mg daily for 1 dose, to be inserted at night
- **BY VAGINA USING CREAM**
  - Child: 1 applicatorful twice daily for 3 days

**DOSE EQUIVALENCE AND CONVERSION**
- 1 applicatorful delivers a 5 g dose of fenticonazole 2%.

**CAUTIONS** Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative.

**SIDE-EFFECTS** Local irritation.

**CONCEPTION AND CONTRACEPTION** Intravaginal cream and vaginal capsules damage latex condoms and diaphragms.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- **Gynoxin (Recordati Pharmaceuticals Ltd)**
  - Fenticonazole nitrate 20 mg per 1 gram
  - Gynoxin 2% vaginal cream
  - 30 gram [POM] £3.74

**Capsule**
- **Gynoxin (Recordati Pharmaceuticals Ltd)**
  - Miconazole nitrate 1.2 gram
  - Gynoxin 1200 mg vaginal capsules
  - 1 capsule [POM] £2.94 DT price = £2.94

---

**Miconazole**

**INDICATIONS AND DOSE**

**Vaginal and vulval candidiasis**
- **BY VAGINA USING CAPSULES**
  - Child: 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary

**CAUTIONS** Avoid in acute porphyrias p. 577: avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative.

**INTERACTIONS** → Appendix 1: antifungals, azoles

**SIDE-EFFECTS**
- Common or very common: Nausea, rash, vomiting
- Frequency not known: Occasional local irritation
Chapter 8
Immune system and malignant disease

Immune system and malignant disease

Immune system disorders and transplantation

Immune response

Inflammatory bowel disease
Azathioprine p. 495, mercaptopurine p. 516, or once weekly methotrexate p. 517 are used to induce remission in unresponsive or chronically active Crohn’s disease.

Azathioprine or mercaptopurine may also be helpful for retaining remission in frequently relapsing inflammatory bowel disease; once weekly methotrexate is used in Crohn’s disease when azathioprine or mercaptopurine are ineffective or not tolerated. Response to azathioprine or mercaptopurine may not become apparent for several months. Folic acid p. 546 should be given to reduce the possibility of methotrexate toxicity. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Ciclosporin (cyclosporin) p. 496 is a potent immunosuppressant and is markedly nephrotoxic. In children with severe ulcerative colitis unresponsive to other treatment, ciclosporin may reduce the need for urgent colorectal surgery.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 503), calcineurin inhibitors (ciclosporin or tacrolimus p. 499), corticosteroids, or sirolimus p. 498. Choice is dependent on the type of organ, time after transplant, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Infections in the immunocompromised child can be severe and show atypical features. Specific local protocols should be followed for the management of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised. Children should be up-to-date with their childhood vaccinations before initiation of immunosuppressant therapy (e.g. before transplantation); vaccination with varicella–zoster vaccine is also necessary during this period—important: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella–zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced (to one quarter of the original dose in children) when allopurinol p. 529 is given concurrently. Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil may reduce the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Children may suffer a high incidence of side-effects, particularly gastrointestinal effects, calling for temporary reduction in dose or interruption of treatment.

Cyclophosphamide p. 509 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

The corticosteroids prednisolone p. 421 and dexamethasone p. 419 are widely used in paediatric oncology; they have a marked antitumour effect. Dexamethasone is preferred for acute lymphoblastic leukaemia whilst prednisolone may be used for Hodgkin’s disease, non-Hodgkin’s lymphoma, and B-cell lymphoma and leukaemia.

Dexamethasone is the corticosteroid of choice in paediatric supportive and palliative care. For children who are not receiving a corticosteroid as a component of their chemotherapy, dexamethasone may be used to reduce raised intracranial pressure, or to help control emesis when combined with an appropriate anti-emetic.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin (cyclosporin), a calcineurin inhibitor, is a potent immunosuppressant which is virtually...
non-myelotoxic but markedly nephrotoxic. It may be used in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease. Ciclosporin also has a role in steroid-sensitive and steroid-resistant nephrotic syndrome; in corticosteroid-sensitive nephrotic syndrome it may be given with prednisolone. Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects.

**Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006) NICE TA99**

When selecting immunosuppressive therapy for renal transplantation in children and adolescents, NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Mycophenolic acid is not recommended as part of an immunosuppressive regimen for renal transplantation in children or adolescents.

Sirolimus [not licensed for use in children] is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

**IMMUNE SERA AND IMMUNOGLOBULINS**

**IMMUNOGLOBULINS**

### Antithymocyte immunoglobulin (rabbit)

#### INDICATIONS AND DOSE

- **Prophylaxis of organ rejection in heart allograft recipients**
  - **By intravenous infusion**
  - Child: 1–2.5 mg/kg daily for 3–5 days, start treatment on day of transplantation, to be given over at least 6 hours

- **Prophylaxis of organ rejection in renal allograft recipients**
  - **By intravenous infusion**
  - Child 1–17 years: 1–1.5 mg/kg daily for 3–9 days, start treatment on day of transplantation, to be given over at least 6 hours

- **Treatment of corticosteroid-resistant allograft rejection in renal transplantation**
  - **By intravenous infusion**
  - Child 1–17 years: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

#### CONTRA-INDICATIONS

- Infection

#### SIDE-EFFECTS

- Anaphylaxis - cytokine release syndrome - diarrhoea - dysphagia - fever - hypotension - increased susceptibility to infection - increased susceptibility to malignancy - infusion-related reactions - lymphopenia - myalgia - nausea - neutropenia - pruritus - rash - serum sickness - shivering - thrombocytopenia - vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

- **Pregnancy**
  - Manufacturer advises use only if potential benefit outweighs risk — no information available.

- **Breast Feeding**
  - Manufacturer advises avoid — no information available.

- **Monitoring requirements**
  - Monitor blood count.

#### DIRECTIONS FOR ADMINISTRATION

For **continuous intravenous infusion** reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with Glucose 5% or Sodium Chloride 0.9% to an approx. concentration of 0.5 mg/mL; begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); incompatible with unfractionated heparin and hydrocortisone in glucose infusion — precipitation reported.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Antithymocyte immunoglobulin (rabbit) (Non-proprietary)**
  - **Antithymoglobulin immunoglobulin (rabbit) 20 mg per 1 ml**
  - Grafalon 100mg/5ml concentrate for solution for infusion vials | 1 vial (PO) no price available

- **Powder and solvent for solution for infusion**
  - **Thymoglobulin (Sanofi)**
    - Antithymocyte immunoglobulin (rabbit) 25 mg
    - Thymoglobulin 25mg powder and solvent for solution for infusion vials | 1 vial (PO) £158.77 (Hospital only)

**IMMUNOSUPPRESANTS**

### Azathioprine

#### Drug action

Azathioprine is metabolised to mercaptopurine.

#### Indications and dose

- **Severe ulcerative colitis**
  - **By mouth**
  - Child 2–17 years: Initially 2 mg/kg once daily, then increased if necessary up to 2.5 mg/kg once daily

- **Systemic lupus erythematosus**
  - **Vasculitis**
  - **Autoimmune conditions usually when corticosteroid therapy alone has proved inadequate**
    - **By mouth**
    - Child: Initially 1 mg/kg daily, then adjusted according to response to 3 mg/kg daily, consider withdrawal if no improvement within 3 months; maximum 3 mg/kg per day

- **Suppression of transplant rejection**
  - **By mouth, or by intravenous infusion**
  - Child: Maintenance 1–3 mg/kg daily, adjusted according to response, consult local treatment protocol for details, oral route preferred, but if oral route is not possible then can be given by intravenous infusion, the total daily dose may alternatively be given in 2 divided doses

- **Dose adjustments due to interactions**
  - Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.
Reduced thiopurine methyltransferase activity

INTERACTIONS → Appendix 1: azathioprine

SIDE-EFFECTS
- Rare Hepatic veno-occlusive disease - lymphoma - pancreatitis - pneumonitis - red cell aplasia
- Frequency not known Arthralgia - cholestatic jaundice - colitis in patients also receiving corticosteroids - diarrhoea - dizziness - dose-related bone marrow suppression - fever - hair loss - herpes zoster infection - hypersensitivity reactions - hypotension - increased susceptibility to infections in patients also receiving corticosteroids - interstitial nephritis - liver impairment - malaise - myalgia - nausea - neutropenia - rash - rigors - thrombocytopenia - vomiting

SIDE-EFFECTS, FURTHER INFORMATION
- Red cell aplasia Cases of pure red cell aplasia have been reported with azathioprine; dose reduction or discontinuation should be considered under specialist supervision.
- Neutropenia and thrombocytopenia Usually resolved by reducing the dose.
- Hypersensitivity reactions Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis) call for immediate withdrawal.

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in hypersensitivity to mercaptopurine.

PREGNANCY Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

BREAST FEEDING Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

HEPATIC IMPAIRMENT Reduce dose. Monitor liver function.

RENAL IMPAIRMENT Reduce dose.

PRE-TREATMENT SCREENING Thiopepurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

MONITORING REQUIREMENTS
- Monitor for toxicity throughout treatment.
- Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
- Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

DIRECTIONS FOR ADMINISTRATION
- With intravenous use Consult local treatment protocol for details. For intravenous injection, reconstitute 50 mg with 5–15 mL Water for Injections; give over at least 1 minute.

Ciclosporin
(Ciclosporin)

DRUG ACTION Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

INDICATIONS AND DOSE
Refractory ulcerative colitis
- BY MOUTH
  - Child 2–17 years: Initially 2 mg/kg twice daily (max. per dose 5 mg/kg twice daily), dose adjusted according to blood-ciclosporin concentration and response
- BY INTRAVENOUS INFUSION
  - Child 3–17 years: Initially 0.5–1 mg/kg twice daily, dose adjusted according to blood-ciclosporin concentration and response

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)
- BY MOUTH
  - Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist monitoring.
lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.

- **INTERACTIONS** → Appendix 1: ciclosporin

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - acne - anorexia - convulsion - diarrhea - fatigue - flushing - gingival hyperplasia - headache - hepatic dysfunction - hirsutism - hyperglycaemia - hyperkalaemia - hyperlipidaemia - hypertension - hyperrholisis - hyperuricaemia - hypomagnesaemia - leucopenia - muscle cramps - myalgia - nausea - paraesthesia - peptic ulcer - pyrexia - renal dysfunction (renal structural changes on long-term administration) - tremor - vomiting
  - **Uncommon** Anaemia - oedema - signs of encephalopathy - thrombocytopenia - weight gain
  - **Rare** Gynaecomastia - haemolytic uraemic syndrome - menstrual disturbances - micro-angiopathic haemolytic anaemia - motor polyneuropathy - muscle weakness - myopathy - pancreatitis
  - **Very rare** Visual disturbances secondary to benign intracranial hypertension
  - **Frequency not known** Migraine - pain in lower extremities
  - **With intravenous use** Anaphylaxis

- **PREGNANCY** Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk — toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk.

- **HEPATIC IMPAIRMENT** Extensively metabolised by the liver—manufacturer advises consider dose adjustment based on bilirubin and liver enzyme levels.

- **RENAL IMPAIRMENT** In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid. In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. During treatment for non-transplant indications, manufacturer recommends if the estimated glomerular filtration rate decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the estimated glomerular filtration rate decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.

- **MONITORING REQUIREMENTS** Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).
  - In long-term management of nephrotic syndrome, perform renal biopsies every 1–2 years.

- **DIRECTIONS FOR ADMINISTRATION**
  - **With oral use** Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.
  - **With intravenous use** For intermittent intravenous infusion, dilute to a concentration of 0.5–2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

- **PRESCRIBING AND DISPENSING INFORMATION** Brand name prescribing. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentrations.
Sirolimus

**DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

**INDICATIONS AND DOSE**
As a component of immunosuppressive therapy for renal transplantation in children and adolescents only if intolerance necessitates the withdrawal of a calcineurin inhibitor

- **BY MOUTH**
- Child: (consult local protocol)

**DOSE EQUIVALENCE AND CONVERSION**
The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should **not** be used as a substitute for other tablet strengths.

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** Hyperlipidaemia · increased susceptibility to infection (especially urinary tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

**INTERACTIONS** → Appendix 1: sirolimus

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain · acne · anaemia · arthropathy · ascites · constipation · diarrhoea · epistaxis · haemolytic uraemic syndrome · headache · hypercholesterolaemia · hyperglycaemia · hypertension · hypertriglyceridaemia · hypokalaemia · hypophosphataemia · impaired healing · leucopenia · lymphocoele · nausea · neutropenia · oedema · osteonecrosis · pleural effusion · pneumonitis · proteinuria · pyrexia · rash · stomatitis · tachycardia · thrombocytopenia · thrombotic thrombocytopenic purpura · venous thromboembolism
- **Uncommon** Nephrotic syndrome · pancreatitis · pancytopenia · periarterial effusion · pulmonary embolism · pulmonary haemorrhage
- **Rare** Alveolar proteinosis · anaphylactic reactions · angioedema · dermatitis · hepatic necrosis · hypersensitivity reactions · hypersensitivity vasculitis · interstitial lung disease · lymphoedema
- **Frequency not known** Focal segmental glomerulosclerosis · reversible impairment of male fertility

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

**PREGNANCY** Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Dose reduction may be necessary, consult local treatment protocols for details. Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

**MONITORING REQUIREMENTS**
- Monitor whole blood-sirolimus trough concentration (Afro–Caribbean patients may require higher doses).
- Monitor kidney function when given with ciclosporin; contraception must be used during treatment and for 12 weeks after stopping.

**DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 ml water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.

**PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus. Patients should be advised to avoid excessive exposure to UV light.

**MEDICINE FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**EXCIPIENTS:** May contain Alcohol, poloxyl, castor oils

- **Sandimmun** (Novartis Pharmaceuticals UK Ltd)
  - Ciclosporin 50 mg per 1 ml Sandimmun 250 mg/mL concentrate for solution for infusion ampoules | 10 ampoule (PO) £48.50 DT price = £68.28

  - Ciclosporin 25 mg Neoral 25 mg capsules | 30 capsule (PO) £18.37

- **Vanquoral** (Teva UK Ltd)
  - Vanquoral 10 mg Vanquoral 10 mg capsules | 30 capsule (PO) £18.25
  - Vanquoral 50 mg Vanquoral 50 mg capsules | 30 capsule (PO) £35.97

**DIETARY AND LIFESTYLE ADVICE**

- **Focal segmental glomerulosclerosis**
  - Excessive exposure to UV light.

**PATIENT AND CARER ADVICE**

- Patients and carers should be counselled on the administration of different formulations of ciclosporin.
- Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA
- Medicines for Children leaflet: Ciclosporin for nephrotic syndrome
- www.medicinesforchildren.org.uk/ciclosporin-nephrotic-syndrome-0

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · acne · anaemia · arthropathy · ascites · constipation · diarrhoea · epistaxis · haemolytic uraemic syndrome · headache · hypercholesterolaemia · hyperglycaemia · hypertension · hypertriglyceridaemia · hypokalaemia · hypophosphataemia · impaired healing · leucopenia · lymphocoele · nausea · neutropenia · oedema · osteonecrosis · pleural effusion · pneumonitis · proteinuria · pyrexia · rash · stomatitis · tachycardia · thrombocytopenia · thrombotic thrombocytopenic purpura · venous thromboembolism
- **Uncommon** Nephrotic syndrome · pancreatitis · pancytopenia · periarterial effusion · pulmonary embolism · pulmonary haemorrhage
- **Rare** Alveolar proteinosis · anaphylactic reactions · angioedema · dermatitis · hepatic necrosis · hypersensitivity reactions · hypersensitivity vasculitis · interstitial lung disease · lymphoedema
- **Frequency not known** Focal segmental glomerulosclerosis · reversible impairment of male fertility

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

**PREGNANCY** Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Dose reduction may be necessary, consult local treatment protocols for details. Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

**MONITORING REQUIREMENTS**

- Monitor whole blood-sirolimus trough concentration (Afro–Caribbean patients may require higher doses).
- Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.

**DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 ml water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 ml of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.

**PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus. Patients should be advised to avoid excessive exposure to UV light.

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** Hyperlipidaemia · increased susceptibility to infection (especially urinary tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

**INTERACTIONS** → Appendix 1: sirolimus

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · acne · anaemia · arthropathy · ascites · constipation · diarrhoea · epistaxis · haemolytic uraemic syndrome · headache · hypercholesterolaemia · hyperglycaemia · hypertension · hypertriglyceridaemia · hypokalaemia · hypophosphataemia · impaired healing · leucopenia · lymphocoele · nausea · neutropenia · oedema · osteonecrosis · pleural effusion · pneumonitis · proteinuria · pyrexia · rash · stomatitis · tachycardia · thrombocytopenia · thrombotic thrombocytopenic purpura · venous thromboembolism
- **Uncommon** Nephrotic syndrome · pancreatitis · pancytopenia · periarterial effusion · pulmonary embolism · pulmonary haemorrhage
- **Rare** Alveolar proteinosis · anaphylactic reactions · angioedema · dermatitis · hepatic necrosis · hypersensitivity reactions · hypersensitivity vasculitis · interstitial lung disease · lymphoedema
- **Frequency not known** Focal segmental glomerulosclerosis · reversible impairment of male fertility

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

**PREGNANCY** Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Dose reduction may be necessary, consult local treatment protocols for details. Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

**MONITORING REQUIREMENTS**

- Monitor whole blood-sirolimus trough concentration (Afro–Caribbean patients may require higher doses).
- Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.

**DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 ml water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 ml of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.

**PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus.

Patients should be advised to avoid excessive exposure to UV light.
Tacrolimus

**INDICATIONS AND DOSE**

**ADOPORT®**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- **BY MOUTH**

- Neonate: Initially 150 micrograms/kg twice daily.

- Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- **BY MOUTH**

- Neonate: Initially 150 micrograms/kg twice daily.

- Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- **BY MOUTH**

- Neonate: Initially 50–150 micrograms/kg twice daily.

- Child: Initially 50–150 micrograms/kg twice daily

**MODIGRAF®**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- **BY MOUTH**

- Neonate: Initially 150 micrograms/kg twice daily.

- Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- **BY MOUTH**

- Neonate: Initially 150 micrograms/kg twice daily.

- Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- **BY MOUTH**

- Neonate: Initially 50–150 micrograms/kg twice daily.

- Child: Initially 50–150 micrograms/kg twice daily

**CAPEXION®**

Allograft rejection resistant to conventional immunosuppressive therapy

- **BY MOUTH**

- Child: Seek specialist advice

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- **BY MOUTH**

- Neonate: Initially 150 micrograms/kg twice daily.

- Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- **BY MOUTH**

- Neonate: Initially 150 micrograms/kg twice daily.

- Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- **BY MOUTH**

- Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

- Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- **BY MOUTH**

- Neonate: Initially 50–150 micrograms/kg twice daily.

- Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- **BY MOUTH**

- Neonate: Initially 150 micrograms/kg twice daily.

- Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- **BY MOUTH**

- Neonate: Initially 150 micrograms/kg twice daily.

- Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- **BY MOUTH**

- Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

- Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- **BY MOUTH**

- Neonate: Initially 50–150 micrograms/kg twice daily.

- Child: Initially 50–150 micrograms/kg twice daily

Allograft rejection resistant to conventional immunosuppressive therapy
- BY MOUTH
- Child: Seek specialist advice

● UNLICENSED USE

ADVAGRAF® Advagraf® not licensed for use in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- Adoport®, Prograf®, Capexion®, Tacni®, and Vivadex® are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- Modigraf® granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- Advagraf® is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: Envarsus® is not interchangeable with other tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

● CAUTIONS

- Increased risk of infections
- Lymphoproliferative disorders
- Malignancies
- Neurotoxicity
- QT-interval prolongation
- UV light (avoid excessive exposure to sunlight and sunlamps)

● INTERACTIONS → Appendix 1: tacrolimus

● SIDE-EFFECTS
- Common or very common Acne, alopecia, anaemia, anorexia, anxiety, arthralgia, ascites, bile-duct abnormalities, bloating, blood disorders, cholestasis, confusion, constipation, depression, diarrhoea, dizziness, dyspepsia, dyspnœa, electrolyte disturbances, flatulence, gastro-intestinal inflammation, gastro-intestinal perforation, gastro-intestinal ulceration, haemorrhage, headache, hepatic dysfunction, hyperglycaemia, hyperkalaemia, hypertension, hyperuricaemia, hypokalaemia, impaired hearing, ischaemic events, jaundice, leucopenia, mood changes, muscle cramp, nausea, oedema, pancytopenia, paraesthesia, parenchymal lung disorders, peripheral neuropathy, photophobia, pleural effusion, psychosis, renal failure, renal impairment, renal tubular necrosis, seizures, sleep disturbances, sweating, tachycardia, thrombocytopenia, thromboembolic events, tinnitus, tremor, urinary abnormalities, visual disturbances, vomiting, weight changes
- Uncommon Amnesia, arrhythmia, cardiac arrest, cardiomyopathy, cataract, cerebrovascular accident, coagulation disorders, coma, dermatitis, dysmenorrhoea, encephalopathy, gastro-intestinal reflux disease, heart failure, hypertonia, hypoglycaemia, influenza-like symptoms, palpitacion, pancreatitis, paralysis, paralytic ileus, peritonitis, photosensitivity, respiratory failure, speech disorder
- Rare Blindness, dehydration, hirsutism, pericardial effusion, posterior reversible encephalopathy syndrome, respiratory distress syndrome, thrombotic thrombocytopenic purpura, toxic epidermal necrolysis
- Very rare Haemorrhagic cystitis, myasthenia, Stevens-Johnson syndrome
- Frequency not known Agranulocytosis, haemolytic anaemia, pure red cell aplasia

SIDE-EFFECTS, FURTHER INFORMATION

- Cardiomyopathy Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.
- Allergy and cross-sensitivity Contra-indicated if history of hypersensitivity to macrolides.
- Conception and contraception Exclude pregnancy before treatment.
- Pregnancy Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- Breast feeding Avoid—present in breast milk (following systemic administration).
- Hepatic impairment Dose reduction may be necessary in severe impairment.
- Monitoring requirements
  - After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
  - Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.

DIRECTIONS FOR ADMINISTRATION

- For continuous intravenous infusion over 24 hours, dilute to a concentration of 4–100 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%, to a total volume between 20–500mL. Tacrolimus is incompatible with PVC.

PRESCRIBING AND DISPENSING INFORMATION

- PROGRAF® INFUSION Intravenous route should only be used if oral route is inappropriate.

PATIENT AND CARER ADVICE

Avoid excessive exposure to UV light including sunlight.

Driving and skilled tasks May affect performance of skilled tasks (e.g. driving).

IMMUNOSUPPRESSANTS  ▶ MONOCLONAL ANTIBODIES

Canakinumab

**DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

**INDICATIONS AND DOSE**
Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome)

- **BY SUBCUTANEOUS INJECTION**
  - **Child:** consult product literature

Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone) in children who have had an inadequate response to NSAIDs and systemic corticosteroids

- **BY SUBCUTANEOUS INJECTION**
  - **Child 2-17 years (body weight 7.5 kg and above):** 4 mg/kg every 4 weeks (max. per dose 300 mg)

**CONTRA-INDICATIONS** Active infection • leucopenia • neutropenia

**CAUTIONS** History of recurrent infection • latent and active tuberculosis • predisposition to infection

**CAUTIONS, FURTHER INFORMATION**
Vaccinations Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.

**INTERACTIONS** Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
• Common or very common Back pain • increased susceptibility to infection (including serious infection) • injection-site reactions • malaise • neutropenia • vertigo

• Uncommon Gastro-oesophageal reflux

• Frequency not known Malignancy • vomiting

**SPECIFIC SIDE-EFFECTS**
• When used for active systemic juvenile idiopathic arthritis Abdominal pain • arthralgia • musculoskeletal pain • rhinitis

**CONCEPTION AND CONCEPTION** Effective contraception required during treatment and for up to 3 months after last dose.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.

**HEPATIC IMPAIRMENT** No information available.

**RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.

**PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.

**MONITORING REQUIREMENTS**
• Monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.

• Monitor for signs and symptoms of tuberculosis during and after treatment.
IMMUNOSUPPRESSANTS  \( \Rightarrow \) MONOCLONAL ANTIBODIES, ANTI-LYMPHOCYTE

### Basiliximab

**Drug Action** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

**Indications and Dose**

- **Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)**
  - **By Intravenous injection, or by Intravenous infusion**
    - Child 1-17 years (body-weight up to 35 kg): Initially 10 mg, dose to be administered within 2 hours before transplant surgery, followed by 10 mg after 4 days, dose administered after transplant surgery, withhold second dose if severe hypersensitivity or graft loss occurs
    - Child 1-17 years (body-weight 35 kg and above): Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs

**Caution**

- Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects
- **Interactions** \( \Rightarrow \) Appendix 1: monoclonal antibodies
- **Side-effects** Atrial flutter, cardiac arrest, cytokine release syndrome, palpitations, severe hypersensitivity reactions

**Conception and Contraception** Adequate contraception must be used during treatment and for 16 weeks after last dose.

**Pregnancy** Manufacturer advises avoid—no information available.

**Breast Feeding** Manufacturer advises avoid—no information available.

**Directions for Administration** For intravenous infusion, dilute reconstituted solution to a concentration not exceeding 400 micrograms/mL, with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes.

**Medicinal Forms**

- **Powder for solution for injection**
  - Basiliximab 10 mg
    - Simulect (Novartis Pharmaceuticals UK Ltd)
      - Basiliximab 10 mg Simulect 10mg powder and solvent for solution for injection vials | 1 vial £758.69 (Hospital only)
    - Basiliximab 20 mg Simulect 20mg powder and solvent for solution for injection vials | 1 vial £842.38 (Hospital only)
  - Canakinumab 150 mg
    - Ilaris (Novartis Pharmaceuticals UK Ltd)

**Unlicensed Use**

**Caution**

- Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) - children (higher incidence of side-effects may call for temporary reduction of dose or interruption) - delayed graft function - increased susceptibility to skin cancer (avoid exposure to strong sunlight) - risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

**Interactions** \( \Rightarrow \) Appendix 1: mycophenolate

**Side-Effects**

- Common or very common Abdominal pain, - acne, - agitation, - alopecia, - anaemia, - anorexia, - anxiety, - arthralgia, - blood disorders, - confusion, - constipation, - convulsions, - cough, - depression, - diarrhoea, - disturbances of blood lipids, - disturbances of electrolytes and blood lipids, - dizziness, - dyspnoea, - flatulence, - gastrointestinal bleeding, - gastrointestinal inflammation, - gastro-intestinal ulceration, - gingival hyperplasia, - headache, - hepatitis, - hyperglycaemia, - hypertension, - hypotension, - ileus, - infections, - influenza-like syndrome, - insomnia, - jaundice, - leucopenia, - malignancy (particularly of the skin), - myasthenic syndrome, - nausea, - oedema, - pancreatitis, - pancytopenia, - paraesthesia, - pleural effusion, - rash, - red cell aplasia, - renal impairment, - skin hypertrophy, - stomatitis, - tachycardia, - taste disturbance, - thrombocytopenia, - tremor, - vasodilatation, - vomiting, - weight loss

- **Frequency not known** Interstitial lung disease, - intestinal villous atrophy, - progressive multifocal leucoencephalopathy, - pulmonary fibrosis

**Side-Effects, Further Information**

- Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.
CONCEPTION AND CONTRACEPTION
Pregnancy prevention In females of child-bearing potential, exclude pregnancy immediately before and during treatment.

Women should use 2 methods of effective contraception during treatment, and for 6 weeks after discontinuation. Men should use condoms during treatment and for at least 90 days after discontinuation of treatment; female partners of male patients should also use effective contraception during treatment and for 90 days after discontinuation.

PREGNANCY Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

RENAL IMPAIRMENT Manufacturer advises consider dose reduction if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².

MONITORING REQUIREMENTS Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).

PRESCRIBING AND DISPENSING INFORMATION Tablets and capsules not appropriate for dose titration in children with body surface are less than 1.25 m².

PATIENT AND CARER ADVICE
Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

Malignant disease

1 Antibody responsive malignancy

IMMUNOSUPPRESSANTS ➔ MONOCLONAL ANTIBODIES, ANTI-LYMPHOCYTE

Anti-lymphocyte monoclonal antibodies

DRUG ACTION The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

IMPORTANT SAFETY INFORMATION
All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

SIDE-EFFECTS

Common or very common Allergic reactions • angioedema • bronchospasm • chills • cytokine release syndrome • dyspnoea • fever • flushing • nausea • pruritus • rash • tumour pain • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Infusion-related side effects Infusion-related side-effects occur predominantly during the first infusion. Patients should be given paracetamol and an antihistamine before each dose of anti-lymphocyte monoclonal antibodies to reduce infusion-related side-effects. Premedication with a corticosteroid should also be considered.

The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

Cytokine release syndrome Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

PRE-TREATMENT SCREENING All patients should be screened for hepatitis B before treatment.
**Rituximab**

**INDICATIONS AND DOSE**

Post-transplantation lymphoproliferative disease (under expert supervision) | Non-Hodgkin’s lymphoma (under expert supervision) | Hodgkin’s lymphoma (under expert supervision) | Severe cases of resistant immune modulated disease including idiopathic thrombocytopenia purpura, haemolytic anaemia, and systemic lupus erythematosus (under expert supervision)

- **BY INTRAVENOUS INFUSION**
  - Child: Patients should receive premedication before each dose (consult product literature for details) (consult local protocol)

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported; transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

**CAUTIONS, FURTHER INFORMATION**

- Hepatitis B infection and reactivation: Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking rituximab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

  For full details on cautions, consult product literature or local treatment protocol.

**INTERACTIONS** → Appendix 1: monoclonal antibodies

**SIDE-EFFECTS** Abdominal pain | anaemia | antibody formation | aplastic anaemia | arthralgia | asthenia | blood disorders | depression | dyspepsia | headache | hypertension | hypotension | injection-site reactions | leucopenia | lupus erythematosus-like syndrome | migraine | muscle spasm | pancytopenia | paraesthesia | progressive multifocal leucoencephalopathy | pruritus | rhinitis | severe fatal skin reactions | severe skin reactions (permanently discontinue treatment if occurs) | sore throat | Stevens-Johnson syndrome (permanently discontinue treatment if occurs) | thrombocytopenia | toxic epidermal necrolysis (permanently discontinue treatment if occurs) | urticaria | worsening heart failure

**SIDE-EFFECTS, FURTHER INFORMATION**

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

- Progressive multifocal leucoencephalopathy: Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

  For full details, including management of side-effects, consult product literature.

**CONCEPTION AND CONTRACEPTION** Effective contraception (in both sexes) required during and for 12 months after treatment.

**PREGNANCY** Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.

---

**Cytotoxic responsive malignancy**

**Cytotoxic drugs**

**Overview**

The management of childhood cancer is complex and is generally confined to specialist regional centres and some associated shared-care units.

Cytotoxic drugs have both anti-cancer activity and the potential for damage to normal tissue. In children, chemotherapy is almost always started with curative intent, but may be continued as palliation if the disease is refractory.

Chemotherapy with a combination of two or more cytotoxic drugs aims to reduce the development of resistance and to improve cytotoxic effect. Treatment protocols generally incorporate a series of treatment courses at defined intervals with clear criteria for starting each course, such as adequate bone-marrow recovery and renal or cardiac function. The principal component of treatment for leukaemias in children is cytotoxic therapy, whereas solid tumours may be managed with surgery or radiotherapy in addition to chemotherapy.

Only medical or nursing staff who have received appropriate training should administer parenteral cytotoxics. In most instances central venous access will be required for the intravenous administration of cytotoxics to children; care is required to avoid the risk of extravasation (see Side-effects of Cytotoxic Drugs and their Management).

**Guidelines for handling cytotoxic drugs**

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

**Intrathecal chemotherapy**

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local
guidance covering all aspects of national guidance should be available. Support for training programmes is also available. Copies, and further information may be obtained from: Department of Health PO Box 777 London SE1 6XH Fax: 01623 724524 It is also available from the Department of Health website (www.dh.gov.uk).

Safe systems for cytotoxic medicines:

Safe system requirements for cytotoxic medicines:

- Cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care that is co-ordinated by a multi-disciplinary team
- Cytotoxic drugs should be prescribed, dispensed and administered only in the context of a written protocol or treatment plan
- Injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- Oral cytotoxic medicines should be dispensed with clear directions for use

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- Non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- Staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

### Doses

Doses of cytotoxic drugs are determined using a variety of different methods including age, body-surface area, or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from many of the drug entries in this chapter.

### Pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended).

Alkylating drugs can have an adverse effect on gametogenesis, which may be reversible particularly in females. Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy. Amenorrhoea may occur, which also may be reversible.

### Side-effects of cytotoxic drugs and their management

#### Gastro-intestinal effects

Management of gastrointestinal effects of cytotoxic drugs includes the use of antacids, H₂-receptor antagonists, and proton pump inhibitors to protect the gastric mucosa, laxatives to treat constipation, and enteral and parenteral nutritional support.

#### Oral mucositis

Good oral hygiene keeps the mouth clean and moist and helps to prevent mucositis; prevention is more effective than treatment of the complication. Good oral hygiene measures for children over 6 months include brushing teeth with a soft brush with fluoride toothpaste 2–3 times daily, and rinsing the mouth frequently. Daily fluoride supplements can be used on the advice of the child’s dental team. For children under 6 months or when it is not possible to brush teeth, carers should be instructed how to clean the mouth using an oral sponge moistened with water or with an antimicrobial solution such as diluted chlorhexidine. Mucositis related to chemotherapy can be extremely painful and may, in some circumstances, require opioid analgesia.

Secondary infection with candida is frequent; treatment with a systemically absorbed antifungal, such as fluconazole p. 358, is effective.

#### Nausea and vomiting

Nausea and vomiting cause considerable distress to many children who receive chemotherapy, and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Susceptibility to nausea and vomiting may increase with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered, and to the individual’s susceptibility to emetogenic stimuli.

**Mildly emetogenic treatment** — fluorouracil, etoposide p. 522, low doses of methotrexate p. 517, the vinca alkaloids, and abdominal radiotherapy.

**Moderately emetogenic treatment** — carboplatin p. 520, doxorubicin hydrochloride p. 513, intermediate and low doses of cyclophosphamide p. 509, mitoxantrone p. 514, and high doses of methotrexate.

**Highly emetogenic treatment** — cisplatin p. 521, dacarbazine p. 510, and high doses of alkylating drugs.

Anti-emetic drugs, when given regularly, help prevent or ameliorate emesis associated with chemotherapy in children.
Prevention of acute symptoms: For patients at low risk of emesis, pretreatment with a 5HT3-receptor antagonist may be of benefit.

For patients at high risk of emesis or when other treatment is inadequate, a 5HT3-receptor antagonist is often highly effective. The addition of dexamethasone p. 419 and other anti-emetics may also be required.

Prevention of delayed symptoms: dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide hydrochloride p. 252. Due to the risks of neurological side-effects, metoclopramide hydrochloride should only be used in children as a second-line option. The 5HT3-receptor antagonists may have a role in preventing uncontrolled symptoms.

Prevention of anticipatory symptoms: Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam p. 214 can be helpful for its annesiac, sedative, and anxiolytic effects.

Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 523 and bleomycin p. 520 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as melphalan p. 511. Peripheral blood counts must be checked before each treatment. The duration and severity of neutropenia can be reduced by the use of granulocyte-colony stimulating factors; their use should be reserved for children who have previously experienced severe neutropenia.

Cytotoxic drugs may be contra-indicated in children with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Infection in a child with neutropenia requires immediate broad-spectrum antibacterial treatment that covers all likely pathogens. Appropriate bacteriological investigations should be conducted as soon as possible. Children taking cytotoxic drugs who have signs or symptoms of infection (or their carers) should be advised to seek prompt medical attention. All children should be investigated and treated under the supervision of an appropriate oncology or haematology specialist. Antifungal treatment may be required in a child with prolonged neutropenia or fever lasting longer than 4–5 days. Chickenpox and measles can be particularly hazardous in immunocompromised children.

Varicella–zoster immunoglobulin p. 746 is indicated if the child does not have immunity against varicella and has had close contact with infectious chickenpox or herpes zoster.

Antiviral prophylaxis can be considered in addition to varicella–zoster immunoglobulin or as an alternative if varicella–zoster immunoglobulin is inappropriate. If an immunocompromised child has come into close contact with an infectious individual with measles, normal immunoglobulin p. 743 should be given.

For advice on the use of live vaccines in individuals with impaired immune response, see Vaccines.

Alopecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients.

Long-term and delayed toxicity

Cytotoxic drugs may produce specific organ-related toxicity in children (e.g. cardiotoxicity with doxorubicin hydrochloride p. 513 or nephrotoxicity with cisplatin p. 521 and ifosfamide p. 510). Manifestations of such toxicity may not appear for several months or even years after cancer treatment. Careful follow-up of survivors of childhood cancer is therefore vital; national and local guidelines have been developed to facilitate this.

Thromboembolism

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin’s lymphoma (especially if high grade and bulky disease), Burkitt’s lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration and renal impairment are also predisposing factors. Features, include hyperkalaemia, hyperuricaemia, and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early recognition of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Treatment for cytotoxic-induced side effects

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 529 is used routinely in children at low to moderate risk of hyperuricaemia. It should be started 24 hours before treatment; patients should be adequately hydrated (consideration should be given to omitting phosphate and potassium from hydration fluids). The dose of mercaptopurine p. 516 or azathioprine p. 495 should be reduced if allopurinol is given concomitantly.

Rasburicase p. 529 is a recombinant urate oxidase used in children who are at high-risk of developing hyperuricaemia. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Methotrexate-induced mucositis and myelosuppression

Folinic acid p. 528 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folinic acid rescue’).

The calcium salt of lelofolinic acid p. 528, a single isomer of folinic acid, is also used following methotrexate administration. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate administration.

The efficacy of high dose methotrexate is enhanced by delaying initiation of folinic acid for at least 24 hours, local protocols define the correct time. Folinic acid is normally continued until the plasma-methotrexate concentration falls to 45–90 nanograms/mL (100–200 nanomol/litre).

In the treatment of methotrexate p. 517 overdose, folinate should be administered immediately; other measures to enhance the elimination of methotrexate are also necessary.

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 509 and ifosfamide p. 510; it is caused by the metabolite acrolein. Adequate hydration is essential to reduce the risk of urothelial toxicity. Mesna p. 527 reacts specifically with acrolein in the urinary tract, preventing toxicity. Mesna is given for the same duration as cyclophosphamide or ifosfamide. It is generally given intravenously; the dose of mesna is equal to or greater than that of the oxazaphosphorine. See the role of nebulised mesna as a mucolytic in cystic fibrosis.

Cytotoxic antibiotics

Cytotoxic antibiotics are widely used. Many act as radiomimetics and simultaneous use of radiotherapy should be avoided because it may markedly increase toxicity.

Daunorubicin p. 516, doxorubicin hydrochloride p. 513, and epirubicin hydrochloride p. 513 are anthracycline
antibiotics. Mitoxantrone p. 514 (mitozastrone) is an anthracycline derivative.

Epirubicin hydrochloride and mitoxantrone are considered less toxic than the other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.

**Vincal alkaloids**
The vincal alkaloids, vinblastine sulfate p. 522 and vincristine sulfate p. 523 are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours.

**Antimetabolites**
Antimetabolites are incorporated into new nuclear material or they combine irreversibly with cellular enzymes and prevent normal cellular division. Cytarabine p. 515, fludarabine phosphate p. 515, mercaptopurine p. 516, methotrexate p. 517, and tioguanine p. 519 are commonly used in paediatric chemotherapy.

**Other antineoplastic drugs**
Asparaginase
Asparaginase is used almost exclusively in the treatment of acute lymphoblastic leukaemia. Hypersensitivity reactions may occur and facilities for the management of anaphylaxis should be available. A number of different preparations of asparaginase exist and only the product specified in the treatment protocol should be used.

**ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS**

**Busulfan**
(Busulphan)

**INDICATIONS AND DOSE**
Conditioning treatment before haematopoietic progenitor cell transplantation

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
- **Child:** (consult local protocol)

**DOSES AT EXTREMES OF BODY-WEIGHT**
Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

**IMPORTANT SAFETY INFORMATION**
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

**CAUTIONS**
Avoid in acute porphyrias p. 577 • high dose (anti-epileptic prophylaxis required) • history of seizures (anti-epileptic prophylaxis required) • ineffective once in blast crisis phase • previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) • previous radiation therapy (increased risk of hepatic veno-occlusive disease) • risk of second malignancy • three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)

**INTERACTIONS** → Appendix 1: alkylating agents

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- **Common or very common** Cardiac tamponade in thalassaemia • hepatic fibrosis • hepatic veno-occlusive disease • hepatotoxicity • hyperbilirubinaemia • jaundice • pneumonia • skin hyperpigmentation
- **Rare** Aplastic anaemia • erythema • hypersensitivity reactions • progressive pulmonary fibrosis • seizures • uticaria • visual disturbances
- **Very rare** Gynaecomastia • myasthenia gravis
- **Frequency not known** Alopecia • amenorrhoea (may be reversible) • bone-marrow suppression • dilutional

**SPEClNC SIDE-EFFECTS**
- With intravenous use Extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**
- Lung toxicity Discontinue if lung toxicity develops.
- Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vincal alkaloids.

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises effective contraception during and for 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**PREGNANCY**
Avoid (teratogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Manufacturer advises caution. In patients with hepatic impairment, manufacturer advises regular liver function tests—consult product literature.

**MONITORING REQUIREMENTS**
- Monitor cardiac and liver function.
- Monitor full blood count regularly throughout treatment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**
- **Busulfan (Non-proprietary)**
- Busulfan 2 mg Busulfan 2mg tablets | 25 tablet [Pack] £69.02

**Solution for infusion**
- **Busilvex (Pierre Fabre Ltd)**
- Busulfan 6 mg per 1 ml Busilvex 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule [Pack] £1,610.00 (Hospital only)

**Chlorambucil**

**INDICATIONS AND DOSE**
Hodgkin’s disease • Non-Hodgkin’s lymphoma
- **BY MOUTH**
- **Child:** (consult local protocol)

Relapsing steroid-sensitive nephrotic syndrome (initiated in specialist centres)
- **BY MOUTH**
- **Child 3 months-17 years:** 200 micrograms/kg daily for 8 weeks

**UNLICENSED USE**
Not licensed for use in nephrotic syndrome.

**IMPORTANT SAFETY INFORMATION**
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 505.

**CAUTIONS**
Avoid in acute porphyrias p. 577 • children with nephrotic syndrome (increased seizure risk) • history of epilepsy (increased seizure risk)

**INTERACTIONS** → Appendix 1: alkylating agents
Cyclophosphamide

**INDICATIONS AND DOSE**

- **Acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, retinoblastoma, neuroblastoma, rhabdomyosarcoma, soft-tissue sarcomas, Ewing tumour, neuroectodermal tumours (including medulloblastoma), infant brain tumours, ependymoma, high-dose conditioning for bone marrow transplantation, lupus nephritis**
  - **BY MOUTH**
  - **Child 3 months-17 years:** 2–3 mg/kg daily for 8 weeks
  - **BY INTRAVENOUS INFUSION**
  - **Child 3 months-17 years:** 500 mg/m² once a month for 6 months

**SIDE-EFFECTS**

- **Uncommon** Skin rash
- **Rare** Hepatotoxicity - jaundice - seizures
- **Very rare** Irreversible bone-marrow suppression - male sterility (in prepubertal and pubertal males) - peripheral neuropathy - pulmonary fibrosis - sterile cystitis - tremor
- **Frequency not known** Alopecia - amenorrhoea - bone-marrow suppression - dilutional hyponatraemia - fluid retention - gastro-intestinal effects - hyperuricaemia - nausea - oedema - oral mucositis - organ-related toxicity (long-term and delayed) - premature menopause - secondary malignancy - Stevens-Johnson syndrome - thromboembolism - toxic epidermal necrolysis - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

**PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises consider dose reduction in severe impairment—limited information available.

**MONITORING REQUIREMENTS** Monitor full blood count regularly throughout treatment.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Chlorambucil for nephrotic syndrome www.medicinesforchildren.org.uk/chlorambucil-nephrotic-syndrome-0

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Chlorambucil (Non-proprietary)
  - Chlorambucil 2 mg Chlorambucil 2mg tablets | 25 tablet | PBM £42.87 DT price = £42.87

**INDICATED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 505.

**CONTRA-INDICATIONS** Haemorrhagic cystitis

**CAUTIONS**

- Avoid in acute porphyrias p. 577 - diabetes mellitus - previous or concurrent mediastinal irradiation—risk of cardiotoxicity

**INTERACTIONS** → Appendix 1: alkylating agents

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Anorexia - cardiotoxicity at high doses - disturbances of carbohydrate metabolism - inappropriate secretion of anti-diuretic hormone - interstitial pulmonary fibrosis - pancreatitis - pigmentation of nails - pigmentation of palms - pigmentation of soles - urothelial toxicity
- **Rare** Hepatotoxicity - renal dysfunction
- **Frequency not known** Alopecia - amenorrhoea - bone-marrow suppression - dilutional hyponatraemia - fluid retention - gastro-intestinal effects - haemorrhagic cystitis - hyperuricaemia - male sterility - nausea - oedema - oral mucositis - organ-related toxicity (long-term and delayed) - premature menopause - secondary malignancy - thromboembolism - tumour lysis syndrome - vomiting

**SPECIFIC SIDE-EFFECTS**

- With intravenous use Extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Haemorrhagic cystitis and urothelial toxicity Haemorrhagic cystitis is a common manifestation of urothelial toxicity; adequate hydration is essential to reduce the risk of urothelial toxicity with intravenous use of cyclophosphamide; mesna provides further protection against urotoxic effects.
- Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

**PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

**BREAST FEEDING** Discontinue breast-feeding during and for 36 hours after stopping treatment.

**HEPATIC IMPAIRMENT** Reduce dose—consult local treatment protocol for details.

**RENAL IMPAIRMENT** Reduce dose—consult local treatment protocol for details.

**DIRECTIONS FOR ADMINISTRATION** Consult local treatment protocol for details.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Cyclophosphamide for nephritic syndrome www.medicinesforchildren.org.uk/cyclophosphamide-nephrotic-syndrome-0
**Dacarbazine**

**INDICATIONS AND DOSE**

Hodgkin’s disease | Paediatric solid tumours

- By intravenous injection, or by intravenous infusion
- Child: (consult local protocol)

**CAUTIONS**
Caution in handling—irritant to tissues

**INTERACTIONS** → Appendix 1: alkylating agents

**SIDE-EFFECTS**

- Common or very common Anorexia
- Uncommon Blurred vision, confusion, facial flushing, facial paraesthesia, headache, influenza-like symptoms, rash, renal impairment, seizures
- Rare Diarrhoea, hepatic vein thrombosis, hepatotoxicity, injection-site reactions, irritant to skin, irritant to tissues, liver necrosis, photosensitivity
- Frequency not known Alopecia, bone-marrow suppression, extravasation, gastro-intestinal effects, hyperuricaemia, nausea, oral mucositis, organ-related toxicity (long-term and delayed), thrombocytopenia, tumour lysis syndrome, vomiting

**CONCEPTION AND CONTRACEPTION**
Ensure effective contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**PREGNANCY**
Avoid (carcinogenic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT**
Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

**PRESCRIBING AND DISPENSING INFORMATION**
Dacarbazine is a component of a commonly used combination for Hodgkin’s disease (ABVD—doxorubicin [previously Adriamycin®], bleomycin, vinblastine, and dacarbazine).

**Ifosfamide**

**INDICATIONS AND DOSE**

Rhabdomyosarcoma | Soft-tissue sarcomas | Ewing tumour

- Germ cell tumour | Osteogenic sarcoma

→ By intravenous infusion

**CONTRA-INDICATIONS**
Acute infection, urinary-tract infection, urinary-tract obstruction, urothelial damage

**CAUTIONS**
Avoid in acute porphyrias p. 577

**INTERACTIONS** → Appendix 1: alkylating agents

**SIDE-EFFECTS**

- Common or very common Confusion, disorientation, drowsiness, psychosis, renal toxicity (may lead to tubular dysfunction, Fanconi’s syndrome, or diabetes insipidus), restlessness, urethelial toxicity causing haemorrhagic cystitis and dysuria
- Uncommon Severe encephalopathy
- Rare Anorexia, constipation, convulsions, diarrhoea
- Very rare Jaundice, syndrome of inappropriate antidiuretic hormone secretion, thrombophlebitis
- Frequency not known Alopecia, amenorrhoea, bone-marrow suppression, dilutional hyponatraemia, extravasation, fluid retention, gastro-intestinal effects, hyperuricaemia, male sterility, nausea, oedema, oral mucositis, organ-related toxicity (long-term and delayed), premature menopause, secondary malignancy, thrombocytopenia, tumour lysis syndrome, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Urothelial toxicity Adequate hydration may reduce the risk of urothelial toxicity with intravenous use of ifosfamide; mesna provides further protection against urotoxic effects.
- Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**PREGNANCY**
Avoid (teratogenic and carcinogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Avoid.

**RENAL IMPAIRMENT**
Avoid.

**MONITORING REQUIREMENTS**
Ensure satisfactory electrolyte balance and renal function before each course
(risk of tubular dysfunction, Fanconi’s syndrome or diabetes insipidus if renal toxicity not treated promptly).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- *Ifosfamide (Non-proprietary)*
  - Ifosfamide 1 gram: Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial (PoM) £91.32
  - Ifosfamide 2 gram: Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial (PoM) £179.88

**Melphalan**

**INDICATIONS AND DOSE**
High intravenous dose with haematopoietic stem cell transplantation in the treatment of childhood neuroblastoma and some other advanced embryonal tumours

- **BY INTRAVENOUS INFUSION**
- **Child:** (consult local protocol)

**UNLICENSED USE** Not licensed for use in embryonal tumours.

**IMPORTANT SAFETY INFORMATION**
**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 505.

**CAUTIONS** Avoid in acute porphyrias p. 577 - consider use of prophylactic anti-infective agents - for high-dose intravenous administration establish adequate hydration - haematopoietic stem cell transplantation essential for high dose treatment (consult local treatment protocol for details).

**INTERACTIONS** 
- **Appendix 1:** alkylating agents
- **SIDE-EFFECTS**
  - **RARE** Intestinal pneuomonitis - life threatening pulmonary fibrosis
  - **FREQUENCY NOT KNOWN** Alopecia - amenorrhoea - bone-marrow suppression (delayed) - dilutional hyponatraemia - fluid retention - gastro-intestinal effects - hyperuricaemia - male sterility - nausea - oedema - oral mucositis - organ-related toxicity (long-term and delayed) - thrombocytopenia - tumour lysis syndrome - vomiting
  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use Extravasation
    - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Secondary malignancy
      - Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
      - Fluid retention
        - Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.
  - **CONCEPTION AND CONTRACEPTION**
    - Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
    - **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.
    - **BREAST FEEDING** Discontinue breast-feeding.
    - **HEPATIC IMPAIRMENT** Use with caution in severe impairment — no information available.
    - **RENAL IMPAIRMENT** Manufacturer advises caution — no information available.

**MONITORING REQUIREMENTS**
- **Monitor full blood count before and throughout treatment.**

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- *Melphalan (Non-proprietary)*
  - Melphalan (as Melphalan hydrochloride) 50 mg: Melphalan 50mg powder and solvent for solution for injection vials | 1 vial (PoM) £137.37

**Temozolomide**

**DRUG ACTION** Temozolomide is structurally related to dacarbazine.

**INDICATIONS AND DOSE**
Treatment of recurrent or progressive malignant glioma

- **BY MOUTH**
- **Child 3-17 years:** (consult local protocol)

**IMPORTANT SAFETY INFORMATION**
**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 505.

**CAUTIONS**
- *Pneumocystis jirovecii* pneumonia — consult product literature for monitoring and prophylaxis requirements
- **INTERACTIONS**
  - **Appendix 1:** alkylating agents
- **SIDE-EFFECTS**
  - Alopecia - bone-marrow suppression - gastro-intestinal effects - hyperuricaemia - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
For further information on side-effects consult product literature.

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

**PREGNANCY**
Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

**BREAST FEEDING**
Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**
Use with caution in severe impairment — no information available.

**RENAL IMPAIRMENT**
Manufacturer advises caution — no information available.

**MONITORING REQUIREMENTS**
- Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles — consider the balance of benefits and risks of treatment if results are abnormal at any point (fetal liver injury reported).
- **Monitor for myelodysplastic syndrome.**
- **Monitor for secondary malignancies.**

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 23, 25

- *Temozolomide (Non-proprietary)*
  - Temozolomide 5 mg: Temozolomide 5mg capsules | 5 capsule (PoM) £16.00
  - Temozolomide 20 mg: Temozolomide 20mg capsules | 5 capsule (PoM) £55.00
  - Temozolomide 100 mg: Temozolomide 100mg capsules | 5 capsule (PoM) £325.00
Cytotoxic responsive malignancy

Thiotepa

- **INDICATIONS AND DOSE**
  - Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy
  - **BY INTRAVENOUS INFUSION**
  - Child: (consult local protocol)

- **CAUTIONS**
  - Avoid in acute porphyrias p. 577

- **INTERACTIONS** → Appendix 1: alkylating agents

- **SIDE-EFFECTS**

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Secondary malignancy
  - Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
  - Fluid retention: Alkylating drugs can cause fluid retention with oedema and dihydropyrimidinase in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

- **PREGNANCY**
  - Avoid (teratogenic and embryotoxic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2012) that thiotepa (Tepadina®) is not recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Powder for solution for infusion**
    - Tepadina (Adienne Pharma & Biotech)
    - Thiotepa 15 mg Tepadina 15mg powder for concentrate for solution for infusion vials | 1 vial (Pm) no price available
    - Thiotepa 100 mg Tepadina 100mg powder for concentrate for solution for infusion vials | 1 vial (Pm) no price available

**ANTINEOPLASTIC DRUGS > ANTHRACYCLINES AND RELATED DRUGS**

Daunorubicin

- **INDICATIONS AND DOSE**
  - Acute myelogenous leukaemia | Acute lymphocytic leukaemia
  - **BY INTRAVENOUS INFUSION**
  - Child: (consult local protocol)

- **UNLICENSED USE**
  - DaunoXome® is not licensed for use in children.

- **CONTRA-INDICATIONS**
  - Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracycline · recent myocardial infarction · severe arrhythmia

  - **CONTRA-INDICATIONS, FURTHER INFORMATION**
    - Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

  - **CAUTIONS**
    - Caution in handling—irritant to tissues

  - **INTERACTIONS** → Appendix 1: anthracyclines

- **SIDE-EFFECTS**
  - Common or very common
    - Leucopenia
  - Uncommon
    - Mucositis

  - **Frequency not known**
    - Alopecia - bone-marrow suppression - cardiac toxicity (usually 1–6 months after initiation of therapy) - extravasation - fever - gastro-intestinal effects - hyperuricaemia - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - red urine discoulouration - thromboembolism - tumour lysis syndrome - vomiting

  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Cardiotoxicity: All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible

  - **CONCEPTION AND CONTRACEPTION**
    - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

  - **PREGNANCY**
    - Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

  - **BREAST FEEDING**
    - Discontinue breast-feeding.

  - **HEPATIC IMPAIRMENT**
    - Reduce dose according to serum bilirubin concentration—consult local protocol for details.
    - Avoid in severe impairment.

  - **RENAL IMPAIRMENT**
    - Reduce dose—consult local treatment protocol for details. Avoid in severe impairment.

  - **MONITORING REQUIREMENTS**
    - Cardiac monitoring essential.
    - Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.
**Doxorubicin hydrochloride**

**INDICATIONS AND DOSE**

Some paediatric malignancies | Ewing's sarcoma | Osteogenic sarcoma | Wilm's tumour | Neuroblastoma | Retinoblastoma | Some liver tumours | Acute lymphoblastic leukaemia | Hodgkin's lymphoma | Non-Hodgkin's lymphoma

- **BY INTRAVENOUS INFUSION**
- **Child:** consult local protocol

**CONTRA-INDICATIONS** Acute inflammatory heart disease - consult product literature - increased haemorrhagic tendency - marked persisting myelosuppression induced by previous treatment - marked persisting stomatitis induced by previous treatment - previous myocardial infarction - previous treatment with maximum cumulative doses of doxorubicin - previous treatment with maximum cumulative doses of other anthracycline - severe arrhythmia - severe myocardial insufficiency

**SIDE-EFFECTS**

- **Extravasation** Extravasation can cause severe tissue necrosis.
- **Cardiotoxic** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

**MONITORING REQUIREMENTS** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

**MEDICINAL FORMS**

- **Emulsion for infusion**
  - **Dauonoxome** (Galien Ltd)
    - Doxorubicin (as Daunorubicin hydrochloride citrate)
    - 50 mg: Dauonoxome 50mg emulsion for infusion vials | 1 vial £250.00
  - **Powder for solution for infusion**
    - **Dauorubicin** (Non-proprietary)
      - Doxorubicin (as Daunorubicin hydrochloride)
      - 20 mg: Daunorubicin 20mg powder for solution for infusion vials | 10 vial £65.00 (Hospital only)

- **Solution for injection**
  - **Doxorubicin hydrochloride (Non-proprietary)**
    - Doxorubicin hydrochloride 2 mg per 1 ml
      - Doxorubicin 2mg/10ml solution for injection vials | 1 vial £40.00
  - **Caelyx** (Janssen-Cilag Ltd)
    - Doxorubicin hydrochloride (as Doxorubicin hydrochloride liposomal pegylated) 2 mg per 1 ml
      - Caelyx 2mg/25ml concentrate for solution for infusion vials | 1 vial £360.23

**Powder for solution for injection**

- **Doxorubicin** (medac UK)
  - Doxorubicin hydrochloride 10 mg
    - Doxorubicin 10mg solution for injection vials | 10 vial £182.80
  - Doxorubicin hydrochloride 50 mg
    - Doxorubicin 50mg powder for solution for injection vials | 10 vial £914.00

**Powder and solvent for suspension for infusion**

- **Myocet** (Teva UK Ltd)
  - Doxorubicin hydrochloride 50 mg
    - Myocet 50mg powder and solvent for suspension for infusion vials | 2 vial £912.26 (Hospital only)

**SIDE-EFFECTS**

- **Alopecia**
- **Bone-marrow suppression**
- **Extravasation**: anthracyclines
- **Gastrointestinal effects**: hyperuricaemia
- **Inflammatory heart disease**: irritant to tissues

**Pregnancy**

Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**Contra-indications**

- **Myocardopathy** previous treatment with maximum cumulative doses of epirubicin or other anthracycline - recent myocardial infarction - severe arrhythmia - severe myocardial insufficiency - unstable angina

**Unlicensed Use**

Not licensed for use in children.

**Indications and Contraindications**

- **Recurrent acute lymphoblastic leukaemia**
- **Rhabdomyosarcoma**
- **Other soft-tissue tumours of childhood**

**Caution in handling**

- **Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.**

**Monitoring Requirements**

- Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

- **Caution** in handling of the licensed and different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for injection**

- **Doxorubicin hydrochloride (Non-proprietary)**
  - Doxorubicin hydrochloride 2 mg per 1 ml
    - Doxorubicin 2mg/10ml solution for injection vials | 1 vial £8.54 (Hospital only)
  - Doxorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial £103.00
  - Doxorubicin 50mg/25ml solution for injection vials | 1 vial £103.00 (Hospital only)
  - Doxorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial £20.60
  - Doxorubicin 10mg/5ml concentrate for solution for infusion vials | 1 vial no price available
  - Doxorubicin 10mg/5ml solution for infusion vials | 1 vial £92.70 (Hospital only)
  - Doxorubicin 50mg/25ml concentrate for solution for infusion vials | 1 vial no price available

**Solution for infusion**

- **Doxorubicin hydrochloride (Non-proprietary)**
  - Doxorubicin hydrochloride 2 mg per 1 ml
    - Doxorubicin 200mg/100ml solution for injection Cytosafe vials | 1 vial £412.00
  - Doxorubicin 200mg/100ml solution for injection vials | 1 vial £370.80—£412.00 (Hospital only)

**Powder for solution for injection**

- **Doxorubicin** (medac UK)
  - Doxorubicin hydrochloride 10 mg
    - Doxorubicin 10mg powder for solution for injection vials | 10 vial £182.80
  - Doxorubicin hydrochloride 50 mg
    - Doxorubicin 50mg powder for solution for injection vials | 10 vial £914.00

**Electrolytes**

May contain Sodium

- **Myocet** (Teva UK Ltd)
  - Doxorubicin hydrochloride 50 mg
    - Myocet 50mg powder and solvent for suspension for infusion vials | 2 vial £912.26 (Hospital only)

**Indications and Contraindications**

- **Recurrent acute lymphoblastic leukaemia**
- **Rhabdomyosarcoma**
- **Other soft-tissue tumours of childhood**

- **Caution** in handling—irritant to tissues

**Monitoring Requirements**

- Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

**Contra-indications**

- **Myocardopathy** previous treatment with maximum cumulative doses of epirubicin or other anthracycline - recent myocardial infarction - severe arrhythmia - severe myocardial insufficiency - unstable angina

**Unlicensed Use**

Not licensed for use in children.

**Indications and Contraindications**

- **Recurrent acute lymphoblastic leukaemia**
- **Rhabdomyosarcoma**
- **Other soft-tissue tumours of childhood**

**Caution in handling**

- **Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.**

**Monitoring Requirements**

- Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

**Contra-indications**

- **Myocardopathy** previous treatment with maximum cumulative doses of epirubicin or other anthracycline - recent myocardial infarction - severe arrhythmia - severe myocardial insufficiency - unstable angina

**Unlicensed Use**

Not licensed for use in children.

**Indications and Contraindications**

- **Recurrent acute lymphoblastic leukaemia**
- **Rhabdomyosarcoma**
- **Other soft-tissue tumours of childhood**

**Caution in handling**

- **Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.**

**Monitoring Requirements**

- Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

**Contra-indications**

- **Myocardopathy** previous treatment with maximum cumulative doses of epirubicin or other anthracycline - recent myocardial infarction - severe arrhythmia - severe myocardial insufficiency - unstable angina
colouration of the urine • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
- Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.
- Cumulative doses of other anthracyline Epirubicin is considered less toxic than other anthracyline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.

CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

PREGNANCY Avoid (carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

BREAST FEEDING Discontinue breast-feeding.

HEPATIC IMPAIRMENT Reduce dose according to bilirubin concentration—consult local treatment protocol for details. Avoid in severe impairment.

RENAL IMPAIRMENT Dose reduction may be necessary in severe impairment.

MONITORING REQUIREMENTS
- Cardiac toxicity Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection
- Epirubicin hydrochloride (Non-proprietary)
  Epirubicin hydrochloride 2 mg per 1 ml Epirubicin 50mg/25ml solution for injection vials | 1 vial [POM] £100.88
  Epirubicin 10mg/5ml solution for injection vials | 1 vial [POM] £17.38
- Pharmorubicin (Pfizer Ltd)
  Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial [POM] £106.19
  Pharmorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial [POM] £21.24

Solution for infusion
- Epirubicin hydrochloride (Non-proprietary)
  Epirubicin hydrochloride 2 mg per 1 ml Epirubicin 100mg/50ml solution for infusion vials | 1 vial [POM] no price available
  Epirubicin 200mg/100ml solution for infusion vials | 1 vial [POM] £347.55
- Pharmorubicin (Pfizer Ltd)
  Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 200mg/100ml solution for infusion Cytosafe vials | 1 vial [POM] £386.16

Mitoxantrone (Mitozantrone)

INDICATIONS AND DOSE
Acute myeloid leukaemia | Recurrent acute lymphoblastic leukaemia
- By intravenous infusion
- Child: (consult local protocol)

UNLICENSED USE Not licensed for use in children.

CONTRA-INDICATIONS
CONTRA-INDICATIONS, FURTHER INFORMATION
Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

INTERACTIONS → Appendix 1: anthracyclines

SIDE-EFFECTS
- Common or very common Transient blue-green discoloration of urine
- Uncommon Allergic reactions • amenorrhoea • anorexia • dyspnoea • fatigue • fever • gastro-intestinal bleeding • transient blue discoloration of nails • transient blue discoloration of skin
- Frequency not known Alopecia • bone-marrow suppression • dose-related cardiotoxicity • extravasation • gastro-intestinal effects • hyperuricaemia • myelosuppression • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
- Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

PREGNANCY Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

BREAST FEEDING Discontinue breast-feeding.

HEPATIC IMPAIRMENT Use with caution—consult local treatment protocol.

MONITORING REQUIREMENTS
- Cardiac toxicity Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- Mitoxantrone (Non-proprietary)
  Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial [POM] £121.85
  Onkotrone (Baxter Healthcare Ltd)
  Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial [POM] no price available
  Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial [POM] no price available

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES
Clofarabine

INDICATIONS AND DOSE
Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens
- By intravenous infusion
- Child 1-17 years: (consult local protocol)

UNLICENSED USE Not licensed for use in children under 1 year.

CAUTIONS Cardiac disease

INTERACTIONS → Appendix 1: clofarabine

SIDE-EFFECTS Abdominal pain • agitation • alopecia • anxiety • arthralgia • bone-marrow suppression • cough • diarrhoea • dizziness • drowsiness • dyspnoea • extravasation • flushing • gastro-intestinal effects • haematoma • haematuria • hand-foot (desquamative) syndrome • headache • hyperuricaemia • hypotension • increased sweating • jaundice • myalgia • nausea • oedema • oral mucositis • organ-related toxicity (long-term and delayed) • pancreatitis • paraesthesia • pericardial effusion • peripheral neuropathy • pruritus • rash • restlessness •
tachycardia · thromboembolism · tumour lysis syndrome · vomiting

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Reduce dose—consult product literature.

**RENAI IMPAIRMENT** Consult local treatment protocols.

**MONITORING REQUIREMENTS**
- Haematological monitoring
  - Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.

**PREScribing AND dispensing information**
- Dose is based on weight or body-surface area, children may tolerate higher doses of cytarabine than adults.

**NATIONAL FUNDING/access decisions**
- Scottish Medicines Consortium (SMC) Decisions
  - The Scottish Medicines Consortium has advised (July 2007) that liposomal cytarabine suspension (DepoCyte®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

---

**Cytarabine**

**DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

**INDICATIONS AND DOSE**
- Acute lymphoblastic leukaemia | Acute myeloid leukaemia
- Non-Hodgkin’s lymphoma
  - By intravenous injection, or by intravenous infusion, or by subcutaneous injection
  - Child: (consult local protocol)
- Meningeal leukaemia | Meningeal neoplasms
  - By intrathecal injection
  - Child: (consult local protocol)

**UNLICENSED USE** DepoCyte® intrathecal injection not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**
- Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

**INTERACTIONS** → Appendix 1: cytarabine

**SIDE-EFFECTS**
- **General side-effects**
  - Common or very common: Bone pain · maculopapular rash · myalgia
  - Uncommon: Conjunctivitis (consider prophylactic corticosteroid eye drops) · hepatic dysfunction · jaundice · neurotoxicity · renal dysfunction
  - Frequency not known: Alopecia · bone-marrow suppression · chest pain · extravasation · gastro-intestinal effects · hyperuricaemia · nervous · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

**SPECIFIC SIDE-EFFECTS**
- Common or very common
  - With intravenous use: ‘cytarabine syndrome’ (6–12 hours after intravenous administration—characterised by fever and malaise)
- Rare
  - With intrathecal use: Severe spinal cord toxicity following intrathecal administration

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Reduce dose—consult product literature.

**RENAI IMPAIRMENT** Consult local treatment protocols.

**MONITORING REQUIREMENTS**
- Haematological monitoring

**PREScribing AND dispensing information**
- Dose is based on weight or body-surface area, children may tolerate higher doses of cytarabine than adults.

**NATIONAL FUNDING/access decisions**
- Scottish Medicines Consortium (SMC) Decisions
  - The Scottish Medicines Consortium has advised (July 2007) that liposomal cytarabine suspension (DepoCyte®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

---

**Fludarabine phosphate**

**INDICATIONS AND DOSE**
- Poor prognosis or relapsed acute myeloid leukaemia | Relapsed acute lymphoblastic leukaemia | Conditioning before bone marrow transplantation
  - By mouth, or by intravenous injection, or by intravenous infusion
  - Child: (consult local protocol)

**UNLICENSED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**
- Risks of incorrect dosing of oral anti-cancer medicines
  - See Cytotoxic drugs p. 505.

**CONTRA-INDICATIONS** Haemolytic anaemia

**CAUTIONS** Increased susceptibility to skin cancer · worsening of existing skin cancer

**CAUTIONS, FURTHER INFORMATION**
- Immunosuppression
  - Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host
reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

- **INTERACTIONS** → Appendix 1: fludarabine

- **SIDE-EFFECTS**
  - Common or very common Acute myeloid leukaemia - anorexia - chilling - cough - diarrhoea - fever - immunosuppression - malaise - myelodysplastic syndrome - myelosuppression (may be cumulative) - oedema - peripheral neuropathy - pneumonia - rash - visual disturbances - weakness
  - Uncommon Autoimmune disorder - confusion - fibrosis - haemorrhage - pneumonitis - pulmonary toxicity
  - Rare Agitation - arrhythmia - blindness - coma - heart failure - optic neuropathy - seizures - skin cancer - Stevens-Johnson syndrome - toxic epidermal necrolysis
  - Frequency not known Alopecia - bone-marrow suppression - extravasation - gastrointestinal effects - haemorrhagic cystitis - hyperuricaemia - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - thromboembolism - tumour lysis syndrome - vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY** Avoid (embryotoxic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAI IMPAIRMENT** Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute/1.73 m². Avoid if creatinine clearance less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor for signs of haemolysis.
  - Monitor for neurological toxicity.

- **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Solution for injection**
  - Fludarabine phosphate (Non-proprietary)
    - Fludarabine phosphate 25 mg per 1 mL Fludarabine phosphate 50mg/2ml concentrate for solution for injection vials | 1 vial £156.00 (Hospital only) | 1 vial £155.00
  - Tablet
    - Fludara (Sanofi)
      - Fludarabine phosphate 10 mg Fludara 10mg tablets | 15 tablet £302.48 (Hospital only) | 20 tablet £403.31 (Hospital only)
  - Powder for solution for injection
    - Fludarabine phosphate (Non-proprietary)
      - Fludarabine phosphate 50 mg Fludarabine phosphate 50mg powder for solution for injection vials | 1 vial £155.00 (Hospital only)
      - Fludara (Sanofi)
        - Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial £735.34 (Hospital only)

### Mercaptopurine
(6-Mercaptopurine)

- **INDICATIONS AND DOSE**
  - **Severe ulcerative colitis** | **Severe Crohn’s disease**
    - **BY MOUTH**
      - Child 2-17 years: Initially 1–1.5 mg/kg once daily (max. per dose 50 mg), then increased if necessary up to 75 mg once daily
  - **Acute lymphoblastic leukaemia** | **Lymphoblastic lymphomas**
    - **BY MOUTH**
      - Child: (consult local protocol)

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

- **DOSE EQUIVALENCE AND CONVERSION**
  Mercaptopurine tablets and Xaluprine® oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations.

### IMPORTANT SAFETY INFORMATION
**RISKS OF INCORRECT DOsing OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 505.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Reduced thiopurine methyltransferase activity

- **INTERACTIONS** → Appendix 1: mercaptopurine
- **SIDE-EFFECTS**
  - Rare Crystalluria with haematuria - fever - hyperpigmentation - intestinal ulceration - pancreatitis - rash
  - Very rare Lymphoma
  - Frequency not known Alopecia - bone-marrow suppression - gastrointestinal effects - hepatotoxicity (more frequent at higher doses) - hyperuricaemia - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - thromboembolism - tumour lysis syndrome - vomiting

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.
- **PREGNANCY** Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** May need dose reduction.
- **RENAI IMPAIRMENT** Manufacturer advises consider reducing dose.
Methotrexate

**INDICATIONS AND DOSE**

**Severe Crohn’s disease**
- **By subcutaneous injection, or by intramuscular injection**
- Child 7–17 years: 15 mg/m² once weekly (max. per dose 25 mg)

**Maintenance of remission of severe Crohn’s disease**
- **By mouth, or by subcutaneous injection, or by intramuscular injection**
- Child 7–17 years: 15 mg/m² once weekly (max. per dose 25 mg), dose reduced according to response to lowest effective dose

**Juvenile idiopathic arthritis| Juvenile dermatomyositis | Vasculitis | Uveitis | Systemic lupus erythematosus | Localised scleroderma | Sarcoidosis**
- **By mouth, or by subcutaneous injection, or by intramuscular injection**
- Child: Initially 10–15 mg/m² once weekly, then increased if necessary up to 25 mg/m² once weekly

**Maintenance and remission of acute lymphoblastic leukaemia, lymphoblastic lymphoma**
- **By mouth**
- Child: (consult local protocol)

**Treatment of early stage Burkitt’s lymphoma, non-Hodgkin’s lymphoma, osteogenic sarcoma, some CNS tumours including infant brain tumours, acute lymphoblastic leukaemia**
- **By intravenous injection, or by intravenous infusion**
- Child: (consult local protocol)

**Meningeal leukaemia, treatment and prevention of CNS involvement of leukaemia**
- **By intrathecal injection**
- Child: (consult local protocol)
intestinal bleeding, gastrointestinal ulceration, haematuria, headache, hepatotoxicity, hypotension, impotence, injection-site reactions, insomnia, interstitial pneumonitis, liver cirrhosis, malaise, menstrual disturbances, mood changes, mucositis, myalgia, myelosuppression, nausea, neurotoxicity, osteoporosis, paraesthesia, pericardial tamponade, pericarditis, photosensitivity, pleuritic pain, precipitation of diabetes, pruritis, psychosis, pulmonary fibrosis, pulmonary oedema, rash, reduced libido, renal failure, Stevens-Johnson syndrome, telangiectasia, thrombosis, toxic epidermal necrolysis, toxic megacolon, urticaria, vaginitis, vasculitis, visual disturbance, vomiting

SIDE-EFFECTS, FURTHER INFORMATION
In patients taking methotrexate for non-malignant conditions who experience side-effects, folic acid given on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

**CONCEPTION AND CONTRACEPTION**
Effective contraception required during and for at least 3 months after treatment in men or women.

**PREGNANCY**
Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).

**BREAST FEEDING**
Discontinue breast-feeding—present in milk.

**HEPATIC IMPAIRMENT**
When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.

**RENAL IMPAIRMENT**
Reduce dose. Risk of nephrotoxicity at high doses. Avoid in severe impairment.

**PRE-TREATMENT SCREENING**
Exclude pregnancy before treatment.

Patients should have full blood count and renal and liver function tests before starting treatment.

Check immunity to varicella-zoster and consider vaccination before initiating therapy.

**MONITORING REQUIREMENTS**
Full blood count and liver function tests repeated fortnightly for at least the first 4 weeks of treatment and at this frequency after any change in dose until therapy stabilised, thereafter monthly; renal function tests should be performed regularly during treatment.

**PRESCRIBING AND DISPENSING INFORMATION**
Folinic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression. The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.

**PATIENT AND CARER ADVICE**
Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Children and carers should be advised to avoid self-medication with over-the-counter ibuprofen.

Children and their carers should be counselled on the dose and use of NSAIDs.

Medicines for Children leaflet: Methotrexate for skin conditions www.medicinesforchildren.org.uk/methotrexate-for-skin-conditions

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

**Tablet**

- **Methotrexate (Non-proprietary)**
  - **Methotrexate 2.5 mg**
    - Methotrexate 2.5mg tablets | 24 tablet [PO](£3.75) | 28 tablet [PO](£3.82 DT price = £1.77) | 100 tablet [PO](£14.19)
  - **Methotrexate 10 mg**
    - Methotrexate 10mg tablets | 100 tablet [PO](£15.21 DT price = £3.97)

- **Mexitrex (Pfizer Ltd)**
  - **Methotrexate 2.5 mg**
    - Methotrex 2.5mg tablets | 24 tablet [PO](£2.39) | 100 tablet [PO](£9.96)
  - **Mexitrex 10 mg**
    - Methotrex 10mg tablets | 100 tablet [PO](£45.16 DT price = £37.97)

**Solution for injection**

- **Methotrexate (Non-proprietary)**
  - **Methotrexate (as Methotrexate sodium) 2.5 mg per 1 ml**
    - Methotrexate 5mg/2ml solution for injection vials | 5 vial [PO](£36.00)
  - **Methotrexate (as Methotrexate sodium) 25 mg per 1 ml**
    - Methotrexate 1g/40ml solution for injection vials | 1 vial [PO](£43.68 (Hospital only) | 1 vial [PO](£44.57-67.50) | 100ml solution for injection vials | 1 vial [PO](£38.30 (Hospital only) | 1 vial [PO](£42.56-48.00)
  - **Mexitrex 50mg/2ml solution for injection vials | 1 vial [PO](£4.49 (Hospital only) | 1 vial [PO](£3.00) | 5 vial [PO](£35.00)
  - **Mexitrex 200mg/8ml solution for injection vials | 1 vial [PO](£10.02)
  - **Methotrexate (as Methotrexate sodium) 100 mg per 1 ml**
    - Methotrexate 1g/10ml solution for injection vials | 1 vial [PO](£85.00)

- **Metoject Pen (medac UK)**
  - **Methotrexate 50 mg per 1 ml**
    - Metoject PEN 30mg/0.6ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PO](£18.95)
    - Metoject PEN 22.5mg/0.45ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PO](£18.45)
    - Metoject PEN 12.5mg/0.25ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PO](£16.50)
    - Metoject PEN 20mg/0.4ml solution for injection pre-filled pen | 1 pre-filled disposal injection [PO](£17.50)
    - Metoject PEN 15mg/0.35ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PO](£15.70)
    - Metoject PEN 7.5mg/0.15ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PO](£14.50)
    - Metoject PEN 10mg/0.2ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PO](£15.29)
    - Metoject PEN 7.5mg/0.255ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PO](£18.89)
    - Metoject PEN 25mg/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PO](£15.78)
    - Metoject PEN 15mg/0.3ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PO](£16.57)

- **Nordimet (Nordic Pharma Ltd)**
  - **Methotrexate 25 mg per 1 ml**
    - Nordimet 15mg/0.6ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PO](£14.92)
    - Nordimet 20mg/0.8ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PO](£16.06)
    - Nordimet 22.5mg/0.9ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PO](£16.61)
    - Nordimet 12.5mg/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PO](£14.85)
    - Nordimet 10mg/0.4ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PO](£13.77)
    - Nordimet 17.5mg/0.7ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PO](£15.72)
    - Nordimet 25mg/1ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PO](£16.64)
    - Nordimet 5mg/0.3ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PO](£13.37)
    - Nordimet 25mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PO](£16.64)

- **Zlatal (Nordic Pharma Ltd)**
  - **Methotrexate (as Methotrexate sodium) 25 mg per 1 ml**
    - Zlatal 17.5mg/0.7ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PO](£15.75)
    - Zlatal 10mg/0.4ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PO](£13.77)
    - Zlatal 25mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PO](£16.64)
Zalat 20mg/0.8ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £16.06
Zalat 12.5mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £14.85
Zalat 7.5mg/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £13.37
Zalat 2.5mg/0.1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection | £14.92

Solution for infusion
- Methotrexate (Non-proprietary)
  Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Methotrexate 5g/200ml solution for infusion vials | 1 vial | £200.57
  Methotrexate (as Methotrexate sodium) 100 mg per 1 ml Methotrexate 5g/50ml solution for infusion vials | 1 vial | £400.00
Oral solution
- Methotrexate (Non-proprietary)
  Methotrexate (as Methotrexate sodium) 2 mg per 1 ml Methotrexate 2mg/ml oral solution sugar free sugar-free | 35 ml | £95.00–£114.00 DT price = £95.00 sugar-free
  Methotrexate 5g/50ml solution for infusion vials | 1 vial | £112.50 DT price = £112.50

Nelarabine

- INDICATIONS AND DOSE
  T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in children who have relapsed or who are refractory after receiving at least two previous regimens
  BY INTRAVENOUS INFUSION
  Child: (consult local protocol)

- CAUTIONS
  Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) • Previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

- INTERACTIONS
  Appendix 1: nelarabine

- SIDE-EFFECTS
  Common or very common
  Neurotoxicity (discontinue)
  Frequency not known
  Alopecia • arthralgia • asthenia • ataxia • benign and malignant tumours • bone-marrow suppression • confusion • constipation • demyelination • diarrhoea • drowsiness • electrolyte disturbances • extravasation • fatigue • gastro-intestinal effects • headache • hyperuricaemia • hypoaesthesia • hypoglycaemia • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • paraesthesia • peripheral neurological disorders • pyrexia • seizures • thromboembolism • tremor • tumour lysis syndrome • vomiting

- CONCEPTION AND CONTRACEPTION
  Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

- PREGNANCY
  Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

- BREAST FEEDING
  Discontinue breast-feeding.

- MONITORING REQUIREMENTS
  Neurotoxicity Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

- PATIENT AND CARER ADVICE
  Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

- Solution for infusion
  ELECTROLYTES: May contain Sodium
  ▶ Atriance (Novartis Pharmaceuticals UK Ltd) ▼ Nelorabine 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials | 6 vial | £1,322.00

- CONTRA-INDICATIONS
  Absent thiopurine methyltransferase activity

- CAUTIONS
  Thiopurine methyltransferase status

- FURTHER INFORMATION
  Thiopurine methyltransferase (TPMT). The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

- Long-term therapy
  Long-term therapy is no longer recommended because of the high risk of liver toxicity.

- SIDE-EFFECTS
  Rare
  Intestinal necrosis • intestinal perforation
  Frequency not known
  Alopecia • bone-marrow suppression • gastro-intestinal effects • hepatotoxicity (discontinue) • hyperuricaemia • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • stomatitis • thromboembolism • tumour lysis syndrome • vomiting • vomiting

- SIDE-EFFECTS, FURTHER INFORMATION
  Gastro-intestinal side-effects
  Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

- CONCEPTION AND CONTRACEPTION
  Ensure effective contraception during treatment in men or women.

- PREGNANCY
  Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

- BREAST FEEDING
  Discontinue breast-feeding.

- HEPATIC IMPAIRMENT
  Reduce dose.

- RENAL IMPAIRMENT
  Reduce dose.

- PRE-TREATMENT SCREENING
  Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.

- MONITORING REQUIREMENTS
  Monitor liver function weekly—discontinue if liver toxicity develops.
### Dactinomycin (Actinomycin D)

**INDICATIONS AND DOSE**

- **Wilms’ tumour**
- **Childhood rhabdomyosarcoma and other soft-tissue sarcomas**
- **Ewing’s sarcoma**

**BY INTRAVENOUS INJECTION**

- **Child:** (consult local protocol)

**UNLICENSED USE**

Not licensed for use in children under 12 years.

**CAUTIONS**

Caution in handling—irritant to tissues

**INTERACTIONS**

→ Appendix 1: dactinomycin

**SIDE-EFFECTS**

- **Uncommon** Acne, anaemia, cheilitis, dysphagia, fever, hypoglycaemia, lethargy, malaise, myalgia
- **Rare** Hepatotoxicity (possibly dose-related)
- **Frequency not known** Alopecia, bone-marrow suppression, extravasation, gastro-intestinal effects, hyperuricaemia, nausea, oral mucositis, organ-related toxicity, thromboembolism, tumour lysis syndrome, vomiting

**CONCEPTION AND CONTRACEPTION**

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

**PREGNANCY**

Avoid (teratogenic in animal studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Consider dose reduction if raised serum bilirubin or biliary obstruction; consult local treatment protocols.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Cosmegen (Orphan Europe (UK) Ltd)**
  - Dactinomycin 500 microgram

  | Cosmegen Lyovac 500microgram powder for solution for injection vials | 1 vial | £52.58

**ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS**

| Carboplatin | 10-Jun-2016 |

**INDICATIONS AND DOSE**

- **Stage 4 neuroblastoma**
- **Germ cell tumours**
- **Low-grade gliomas (including astrocytomas)**
- **Neuroectodermal tumours (including medulloblastoma)**
- **Rhabdomyosarcoma (metastatic and non-metastatic disease)**
- **Soft-tissue sarcomas**
- **Retinoblastoma**
- **High risk Wilms’ tumour**
- **Some liver tumours**

**BY INTRAVENOUS INJECTION**

- **Child:** (consult local protocol)

**UNLICENSED USE**

Not licensed for use in children.
**INTERACTIONS**  
- Appendix 1: platinum compounds

**SIDE-EFFECTS**  
- Alopecia  
- Bone-marrow suppression  
- Extravasation  
- Gastro-intestinal effects  
- Hyperuricaemia  
- Myelosuppression  
- Nausea  
- Nausea and vomiting  
- Neurotoxicity  
- Oral mucositis  
- Organ-related toxicity (long-term and delayed)  
- Ototoxicity  
- Thrombocytopenia  
- Tumour lysis syndrome  
- Vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**  
Carboplatin is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

**CONCEPTION AND CONTRACEPTION**  
Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

**PREGNANCY**  
Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

**BREAST FEEDING**  
Discontinue breast-feeding.

**RENAI IMPAIRMENT**  
Reduce dose. Avoid if creatinine clearance less than 20 ml/minute/1.73 m². Monitor haematological parameters in renal impairment. Monitor renal function in renal impairment.

**MONITORING REQUIREMENTS**  
- Consider therapeutic drug monitoring.
- See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

**PRESCRIBING AND DISPENSING INFORMATION**  
Carboplatin can be given in an outpatient setting.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**  
- Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284

Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).

- www.nice.org.uk/TA284

- Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is not recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

- www.nice.org.uk/TA285

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**  
- **Carboplatin (Non-proprietary)**
  - Carboplatin 10 mg per 1 ml
  - Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial (Pom) £22.04 (Hospital only) | 1 vial (Pos) £20.00
  - Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial (Pom) £56.92 (Hospital only) | 1 vial (Pos) £50.00
  - Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial (Pom) £260.00
  - Carboplatin 600mg/60ml solution for infusion vials | 1 vial (Pos) £260.00
  - Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial (Pom) £168.85 (Hospital only) | 1 vial (Pos) £160.00
  - Carboplatin 450mg/45ml solution for infusion vials | 1 vial (Pos) £197.48
  - Carboplatin 150mg/15ml solution for infusion vials | 1 vial (Pos) £65.83
  - Carboplatin 50mg/5ml solution for infusion vials | 1 vial (Pos) £22.86

**Cisplatin**

**INDICATIONS AND DOSE**  
- Osteogenic sarcoma  
- Stage 4 neuroblastoma  
- Some liver tumours  
- Infant brain tumours  
- Intra-cranial germ-cell tumours

- By intravenous infusion
  - Child: (consult local protocol)

**UNLICENSED USE**  
Not licensed for use in children.

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**  
- Hydration  
- Cisplatin requires intensive intravenous hydration; routine use of intravenous fluids containing potassium or magnesium may also be required to help control hypokalaemia and hypomagnesaemia. Treatment may be complicated by severe nausea and vomiting; delayed vomiting may occur and is difficult to control.

**INTERACTIONS**  
- Appendix 1: platinum compounds

**SIDE-EFFECTS**  
- Alopecia  
- Bone-marrow suppression  
- Extravasation  
- Gastro-intestinal effects  
- Hyperuricaemia  
- Hyperuricaemia  
- Hypercalcaemia  
- Hypomagnesaemia  
- Hypophosphataemia  
- Nephrotoxicity (dose-related and potentially cumulative)  
- Neurotoxicity (dose-related and potentially cumulative)  
- Oral mucositis  
- Organ-related toxicity (long-term and delayed)  
- Ototoxicity (dose-related and potentially cumulative)  
- Peripheral neuropathy  
- Severe nausea  
- Severe vomiting

may be delayed and difficult to control

- thrombocytopenia  
- Tumour lysis syndrome

**CONCEPTION AND CONTRACEPTION**  
Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**  
Avoid (teratogenic and toxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 505.

**BREAST FEEDING**  
Discontinue breast-feeding.

**RENAI IMPAIRMENT**  
Avoid if possible—nephrotoxic. Baseline testing of renal function is required; for children with pre-existing renal impairment, consideration should be given to withholding treatment or using another drug.

**MONITORING REQUIREMENTS**  
- Monitor full blood count.
- Monitor audiometry.
- Monitor plasma electrolytes.
- Baseline testing of hearing is required; for children with pre-existing hearing impairment, consideration should be given to withholding treatment or using another drug.
- For children with pre-existing marked bone-marrow suppression, consideration should be given to withholding treatment or using another drug.
- Monitor renal function.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**  
- **Cisplatin (Non-proprietary)**  
  - Cisplatin 1 mg per 1 ml
  - Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial (Pos) £25.11 DT price = £26.47 (Hospital only) | 1 vial (Pos) no price available DT price = £26.47 Cisplatin 100mg/100ml solution for infusion vials | 1 vial (Pos) £50.22 (Hospital only) | 1 vial (Pos) £50.22 £55.64
  - Cisplatin 10mg/10ml solution for infusion vials | 1 vial (Pos) £5.90 (Hospital only) | 1 vial (Pos) £5.90
  - Cisplatin 50mg/50ml solution for infusion vials | 1 vial (Pos) £25.37 DT price = £26.47 (Hospital only) | 1 vial (Pos) £25.37 £28.11 DT price = £26.47 Cisplatin 10mg/10ml concentrate for solution for infusion vials | 1 vial (Pos) £5.90 (Hospital only) | 1 vial (Pos) no price available
  - Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial (Pos) £50.22 (Hospital only) | 1 vial (Pos) no price available

**BNFC 2017–2018**

**Cytotoxic responsive malignancy 521**

**Immune system and malignant disease**
**Etoposide**

- **INDICATIONS AND DOSE**
  Stage 4 neuroblastoma | Germ-cell tumours | Intracranial germ-cell tumours | Rhabdomyosarcoma | Soft-tissue sarcomas | Neuroectodermal tumours (including medulloblastoma) | Relapsed Hodgkin’s disease | Non-Hodgkin’s lymphoma | Acute lymphoblastic leukaemia | Acute myeloid leukaemia
  - By mouth, or by intravenous infusion
  - Child: (consult local protocol)

- **SIDE-EFFECTS**
  General side-effects
  - Alopecia | bone-marrow suppression | dose limiting myelosuppression | gastro-intestinal effects | hyperuricaemia | irritant to tissues | nausea | oral mucositis
  - (more common if given with doxorubicin) | organ-related toxicity | (long-term and delayed) | thromboembolism | tumour lysis syndrome | vomiting

- **INTERACTIONS**
  - Appendix 1: etoposide

- **CAUTIONS**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

- **PREGNANCY**
  - Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Avoid in severe impairment.

- **RENAL IMPAIRMENT**
  - Consider dose reduction—consult local treatment protocol for details.

- **DIRECTIONS FOR ADMINISTRATION**
  - Etoposide is usually given by slow intravenous infusion. It may also be given by mouth, but it is unpredictably absorbed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for infusion**
    - **Etoposide (Non-proprietary)**
      - Etoposide 20 mg per 1 ml | Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial (POM) £11.50 | 10 vials (POM) £115.00
      - Etoposide 500mg/25ml concentrate for solution for infusion vials | 1 vial (POM) £60.75–£70.33 (Hospital only)
    - **Eposin (medac UK)**
      - Etoposide 20 mg per 1 ml | Eposin 500mg/25ml concentrate for solution for infusion vials | 1 vial (POM) £67.50 (Hospital only)
      - Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial (POM) £13.50 (Hospital only)

  - **Powder for solution for injection**
    - **Etopophos (Bristol-Myers Squibb Pharmaceuticals Ltd)**
      - Etoposide (as Etoposide phosphate) 100 mg | Etopophos 100mg powder for solution for injection vials | 10 vials (POM) £261.68 (Hospital only)

**ANTINEOPLASTIC DRUGS ➔ PODOPHYLLOTOXIN DERIVATIVES**

**Etoposide**

- **INDICATIONS AND DOSE**
  - Stage 4 neuroblastoma | Germ-cell tumours | Intracranial germ-cell tumours | Rhabdomyosarcoma | Soft-tissue sarcomas | Neuroectodermal tumours (including medulloblastoma) | Relapsed Hodgkin’s disease | Non-Hodgkin’s lymphoma | Acute lymphoblastic leukaemia | Acute myeloid leukaemia
  - By mouth, or by intravenous infusion
  - Child: (consult local protocol)

- **SIDE-EFFECTS**
  - General side-effects
    - Alopecia | bone-marrow suppression | dose limiting myelosuppression | gastro-intestinal effects | hyperuricaemia | irritant to tissues | nausea | oral mucositis
    - (more common if given with doxorubicin) | organ-related toxicity | (long-term and delayed) | thromboembolism | tumour lysis syndrome | vomiting

- **INTERACTIONS**
  - Appendix 1: etoposide

- **CAUTIONS**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

- **PREGNANCY**
  - Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Avoid in severe impairment.

- **RENAL IMPAIRMENT**
  - Consider dose reduction—consult local treatment protocol for details.

- **DIRECTIONS FOR ADMINISTRATION**
  - Etoposide is usually given by slow intravenous infusion. It may also be given by mouth, but it is unpredictably absorbed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for infusion**
    - **Etoposide (Non-proprietary)**
      - Etoposide 20 mg per 1 ml | Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial (POM) £11.50 | 10 vials (POM) £115.00
      - Etoposide 500mg/25ml concentrate for solution for infusion vials | 1 vial (POM) £60.75–£70.33 (Hospital only)
    - **Eposin (medac UK)**
      - Etoposide 20 mg per 1 ml | Eposin 500mg/25ml concentrate for solution for infusion vials | 1 vial (POM) £67.50 (Hospital only)
      - Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial (POM) £13.50 (Hospital only)

  - **Powder for solution for injection**
    - **Etopophos (Bristol-Myers Squibb Pharmaceuticals Ltd)**
      - Etoposide (as Etoposide phosphate) 100 mg | Etopophos 100mg powder for solution for injection vials | 10 vials (POM) £261.68 (Hospital only)
● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Dose reduction may be necessary—consult local treatment protocol for details.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Vinblastine sulfate (Non-proprietary)
  - Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial £85.00

**Conception and Contraception**

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**Pregnancy**

Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**Breast Feeding**

Discontinue breast-feeding.

**Hepatic Impairment** Dose reduction may be necessary—consult local treatment protocol for details.

**Vinblastine Sulfate**

**Indications and Dose**

**Acute leukaemias | Lymphomas | Paediatric solid tumours**

- **By intravenous injection**
  - **Child:** (consult local protocol)

**Contraindications**

**Contra-indications, Further Information**

Intrathecal injection contra-indicated.

**Cautions**

Caution in handling—irritant to tissues, ileus, neuromuscular disease

**Interactions**

- **Common or very common** Constipation
- **Rare** Convulsions followed by coma, inappropriate secretion of antidiuretic hormone

**Side-effects**

- **Frequency not known** Abdominal pain, alopecia (reversible), autonomic neuropathy, diarrhoea, extravasation, gastro-intestinal effects, hyperuricaemia, intestinal necrosis, loss of deep tendon reflexes, motor weakness, myelosuppression (negligible), nausea, neuromuscular effects (dose-limiting), neurotoxicity, oral mucositis, organ-related toxicity (long-term and delayed), oto-toxicity, paralytic ileus (in young children), peripheral neuropathy, peripheral paraesthesia, severe local irritation (care must be taken to avoid extravasation), thromboembolism, tumour lysis syndrome, urinary retention, vomiting

**Side-effects, Further Information**

- Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vinblastine. Children with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; oto-toxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced, but children generally tolerate vinblastine better than adults.
  - Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.
- **Constipation** Prophylactic use of laxatives may be considered.

**Antineoplastic Drugs**

**Asparaginase**

**Drug Action**

Asparaginase is an enzyme which acts by breaking down L-asparagine to aspartic acid and ammonia, this disrupts protein synthesis of tumour cells.

**Indications and Dose**

**Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)**

- **By intravenous infusion**
  - **Neonate:** (consult product literature or local protocols).
  - **Child 1-11 months:** (consult product literature or local protocols)
  - **Child 1-17 years:** 5000 units/m² every 3 days

**Contra-Indications**

History of pancreatitis related to asparaginase therapy, history of serious haemorrhage related to asparaginase therapy, history of serious thrombosis related to asparaginase therapy, pancreatitis, pre-existing known coagulopathy

**Cautions**

Diabetes (may raise blood glucose), hypersensitivity reactions, hypertriglyceridaemia (severe)—increased risk of acute pancreatitis

**Caution, Further Information**

Hypersensitivity reactions Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—asparaginase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated. Manufacturer advises an intracutaneous or small intravenous test dose can be used but is of limited value for predicting which patients will experience an allergic reaction.

**Interactions**

- **Appendix 1: asparaginase**

**Side-effects**

- **Common or very common** Abdominal pain, acute pancreatitis—discontinue if suspected and do not re-start if confirmed, agitation, anaemia, confusion, decreased appetite, decreased clotting factors, decreased fibrinogen, depression, diarrhoea, dizziness, elevated blood lipids, haemorrhage, hallucination, hyperglycaemia, hypertriglyceridaemia, hypolipidaemia, myelosuppression, nausea, oedema, pain, somnolence, thrombosis, vomiting, weight loss
- **Uncommon** Headache, hyperammonaemia, hyperuricaemia
Rare Convulsion · diabetic ketoacidosis · disturbances in consciousness (including coma) · hepatotoxicity · ischaemic stroke · parotitis · reversible posterior leucoencephalopathy syndrome

Very rare Hypoparathyroidism · hypothyroidism (secondary) · tremor

SIDE-EFFECTS, FURTHER INFORMATION

Hepatotoxicity There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 3 months after last dose; asparaginase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

PREGNANCY Manufacturer advises avoid unless essential—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Manufacturer advises avoid in severe impairment—no information available.

MONITORING REQUIREMENTS

Manufacturer advises monitor trough serum asparaginase levels 3 days after administration; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.

Manufacturer advises monitor bilirubin, hepatic transaminases, and coagulation parameters before and during treatment; in addition, monitor plasma and urinary glucose, amylase, lipase, triglycerides, cholesterol and serum protein levels during treatment.

HANDLING AND STORAGE Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage conditions after reconstitution and dilution.

PATIENT AND CARER ADVICE

Driving and skilled tasks Manufacturer advises asparaginase has moderate influence on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Spectrila (medac UK)

  Asparaginase 10000 unit Spectrila 10,000 unit powder for concentrate for solution for infusion vials | 1 vial £450.00 (Hospital only)

Crisantaspase

DRUG ACTION Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi.

INDICATIONS AND DOSE

Acute lymphoblastic leukaemia | Acute myeloid leukaemia | Non-Hodgkin’s lymphoma

- BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

- Child: (consult local protocol)

UNLICENSED USE Preparations of asparaginase derived from Escherichia coli are available but they are not licensed, they include: Medac® asparaginase and Elspar® asparaginase.

CONTRA-INDICATIONS History of pancreatitis related to asparaginase therapy

CAUTIONS Diabetes (may raise blood glucose)

INTERACTIONS → Appendix 1: crisantaspase

SIDE-EFFECTS

Common or very common Coagulation disorders · confusion · convulsions · diarrhoea · dizziness · drowsiness · headache · lethargy · liver dysfunction · neurotoxicity · pancreatitis

Uncommon Anaphylaxis · changes in blood lipids · hyperglycaemia

Rare CNS depression

Very rare Abdominal pain · hypertension · myalgia

Frequency not known Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

ALLERGY AND CROSS-SENSITIVITY Children who are hypersensitive to asparaginase derived from one organism may tolerate asparaginase derived from another organism but cross-sensitivity occurs in about 20–30% of individuals.

CONCEPTION AND CONTRACEPTION Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

PREGNANCY Avoid. See also, Pregnancy and reproductive function in Cytotoxic drugs p. 505.

BREAST FEEDING Discontinue breast-feeding.

DIRECTIONS FOR ADMINISTRATION Facilities for the management of anaphylaxis should be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Erwinase (EUSA Pharma Ltd)

  Crisantaspase 10000 unit Erwinase 10,000 unit powder for solution for injection vials | 5 vial £3,065.00

Hydroxyuracil

Hydroxyurea

INDICATIONS AND DOSE

Sickle-cell disease in children who have recurrent episodes of acute pain (more than 3 admissions in the previous 12 months, or who are very symptomatic in the community) or who have had 2 or more episodes of acute sickle chest syndrome in the last 2 years (or 1 episode requiring ventilatory support)—consult with a specialist centre

- BY MOUTH

  Child 2–17 years: Initially 10–15 mg/kg once daily, increased in steps of 2.5–5 mg/kg daily, dose to be increased every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 505.

CAUTIONS Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)

INTERACTIONS → Appendix 1: hydroxyuracil

SIDE-EFFECTS

Common or very common Headache · myelosuppression · skin reactions

Rare Amenorrhoea (in sickle-cell disease) · fever (in sickle-cell disease)
Mitotane

**DRUG ACTION** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

**INDICATIONS AND DOSE** Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

- **BY MOUTH**
- Child: (consult local protocol)

**UNLICENSED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES** See Cytotoxic drugs p. 505.

**CAUTIONS** Avoid in acute porphyrias p. 577 • risk of accumulation in overweight patients

**INTERACTIONS** → Appendix 1: mitotane

**SIDE-EFFECTS**

- **Common or very common** Anaemia • anorexia • asthenia • ataxia • cognitive impairment • confusion • diarrhoea • dizziness • drowsiness • epigastric discomfort • gastrointestinal disturbances • gynaecomastia • headache • hypercholesterolaemia • hypertriglyceridaemia • leucopenia • liver disorders • movement disorder • myasthenia • nausea • neuropathy • paraesthesia • prolonged bleeding time • rash • thrombocytopenia • vomiting
- **Rare** Flushing • haematuria • haemorrhagic cystitis • hypersalivation • hypertension • hypouricaemia • ocular disorders • postural hypotension • proteinuria • pyrexia • visual disturbances

- **Frequency not known** Alopecia • bone-marrow suppression • gastro-intestinal effects • hyperuricaemia • nausea • neuropsychological impairment (possibly secondary to hypothyroidism and growth retardation) • oral mucositis • organ-related toxicity (long-term and delayed) • thromboembolism • tumour lysis syndrome • vomiting

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**PREGNANCY** Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment, unless used for malignant conditions.

**RENAL IMPAIRMENT** In sickle-cell disease, reduce initial dose by 50% if estimated glomerular filtration rate less than 60 ml/minute/1.73 m². In sickle-cell disease, avoid if estimated glomerular filtration rate less than 30 ml/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor renal and hepatic function before and during treatment.
- Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).
- Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.

**PATIENT AND CARER ADVICE**

Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.

Medicines for Children leaflet: Hydroxycarbamide for sickle cell disease www.medicinesforchildren.org.uk/hydroxycarbamide-for-sickle-cell-disease

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**

- **Siklos** (Nordic Pharma Ltd)
  - Hydroxycarbamide 100 mg Siklos 100mg tablets | 60 tablet £100.00 DTP = £100.00
  - Hydroxycarbamide 1 gram Siklos 1000mg tablets | 30 tablet £500.00

**Capsule**

- **Hydroxycarbamide (Non-proprietary)**
  - Hydroxycarbamide 500 mg Hydroxycarbamide 500mg capsules | 100 capsule £86.00 DTP = £12.12
  - Droxia (Imported (United States))
  - Hydroxycarbamide 300 mg Droxia 300mg capsules | 60 capsule £85.00 DTP no price available
  - **Hydrea** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Hydroxycarbamide 500 mg Hydrea 500mg capsules | 100 capsule £10.47 DTP = £12.12

**Mitotane**

**Drug action** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

**Indications and dose** Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

- **By mouth**
- Child: (consult local protocol)

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Cautionary and advisory labels** 2, 10, 21

- **Lysodren** (HRA Pharma UK Ltd)
  - Mitotane 500 mg Lysodren 500mg tablets | 100 tablet £59.97

**Unlicensed use** Not licensed for use in children.
Pegaspargase

**DRUG ACTION** Pegaspargase breaks down the amino acid L-asparagine, thereby interfering with the growth of malignant cells, which are unable to synthesise L-asparagine.

**INDICATIONS AND DOSE**

**Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)**

- **By Intramuscular Injection, or by Intravenous Infusion**
  - **Neonate:** 82.5 units/kg every 14 days.
  - **Child (body surface area up to 0.6 m²):** 82.5 units/kg every 14 days
  - **Child (body surface area 0.6 m² and above):** 2500 units/m² every 14 days.

**IMPORTANT SAFETY INFORMATION**

Be aware that doses are calculated either using units/kg or units/m², depending on the size of the child.

**CONTRA-INDICATIONS**

History of pancreatitis — history of serious haemorrhagic event with previous L-asparaginase therapy — history of serious thrombosis with previous L-asparaginase therapy.

**CAUTIONS**

Concomitant use of other hepatotoxic drugs (particularly in pre-existing hepatic impairment) — monitor hepatic function — diabetes (may raise blood glucose) — hypersensitivity reactions — marked decrease of leucocyte count at start of treatment is possible — may be associated with significant rise in serum uric acid and development of uric acid nephropathy.

**CAUTIONS, FURTHER INFORMATION**

- **Hypersensitivity reactions** Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur — pegaspargase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises patients should be closely monitored for signs of hypersensitivity during treatment and for an hour after administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

**INTERACTIONS** → Appendix 1: pegaspargase

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain — convulsion — diarrhoea — elevated blood lipids — hyperglycaemia — hypersensitivity reactions — hypoxia — myelosuppression — pain in extremities — pancreatitis — discontinue if suspected and do not re-start if confirmed — peripheral motor neuropathy — rash — stomatitis — syncope — thrombosis — discontinue treatment — vomiting
- **Rare** Acute renal failure — reversible posterior leukoencephalopathy syndrome
- **Very rare** Tremor
- **Frequency not known** Confusion — decreased clotting factors — decreased fibrinogen — diabetic ketoacidosis — hepatobiliary disorders — hyperammonaemia — monitor if symptoms present — somnolence — toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatobiliary disorders There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 6 months after discontinuing treatment; pegaspargase may reduce effectiveness of oral contraceptives — additional precautions (e.g. barrier method) are required, see also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**PREGNANCY**

Manufacturer advises avoid unless essential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**BRST FEEDING**

Manufacturer advises avoid — no information available.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Manufacturer advises trough serum asparaginase activity levels may be measured before the next administration of pegaspargase; consider switching to a different asparaginase preparation if target levels not reached — seek expert advice.
- Manufacturer advises monitor plasma and urine glucose levels during treatment; monitor coagulation profile at baseline and periodically during and after treatment (particularly with concomitant use of other drugs that inhibit coagulation); monitor serum amylase.

**DIRECTIONS FOR ADMINISTRATION**

Manufacturer advises for intramuscular injection, volumes over 2 ml must be divided between more than one site.

**HANDLING AND STORAGE**

Manufacturer advises store in a refrigerator between 2–8°C.

**PATIENT AND CARER ADVICE**

Pancreatitis Manufacturer advises patients and carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks — increased risk of confusion and somnolence.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Pegaspargase for treating acute lymphoblastic leukaemia (September 2016) NICE TA408**

Pegaspargase, as part of antineoplastic combination therapy, is recommended as an option for treating acute lymphoblastic leukaemia only in patients with untreated newly diagnosed disease.

Patients whose treatment was started within the NHS before this guidance was published may continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta408](http://www.nice.org.uk/guidance/ta408)

**Scottish Medicines Consortium (SMC) Decisions**

The [Scottish Medicines Consortium](http://www.smcond.org.uk) has advised (October 2016) that pegaspargase ([Oncaspar®](http://www.onsaspar.com)) is accepted for use within NHS Scotland as a component of antineoplastic combination therapy in acute lymphoblastic leukaemia.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Pegaspargase (non-proprietary)**

  Pegaspargase 750 unit per 1 ml Oncaspar 3,750 units/5 ml solution for injection vials | 1 vial | [Price](#) | no price available
Procarbazine

**DRUG ACTION** Procarbazine is a mild monoamine-oxidase inhibitor.

**INDICATIONS AND DOSE**

<table>
<thead>
<tr>
<th>Hodgkin's lymphoma</th>
</tr>
</thead>
<tbody>
<tr>
<td>BY MOUTH</td>
</tr>
<tr>
<td>Child: (consult local protocol)</td>
</tr>
</tbody>
</table>

**CONTRA-INDICATIONS** Pre-existing severe leucopenia - pre-existing severe thrombocytopenia

**CAUTIONS** Cardiovascular disease - cerebrovascular disease - epilepsy - phaeochromocytoma - procarbazine is a mild monoamine oxidase inhibitor (dietary restriction is rarely considered necessary)

**INTERACTIONS** → Appendix 1: procarbazine

**SIDE-EFFECTS**

- Common or very common Loss of appetite
- Frequency not known Alopecia - bone-marrow suppression - gastro-intestinal effects - hypersensitivity rash (discontinue treatment) - hyperuricaemia - jaundice - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - thromboembolism - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**PREGNANCY** Avoid (teratogenic in animal studies and isolated reports in humans). See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**BREAST FEEDING** Avoid (discontinue breast-feeding).

**HEPATIC IMPAIRMENT** Reduce dose - consult local treatment protocol for details.

**RENAL IMPAIRMENT** Reduce dose - consult local treatment protocol for details.

**MONITORING REQUIREMENTS** Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

**PRESCRIBING AND DISPENSING INFORMATION** Tretinoin is the acid form of vitamin A.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
- Capsule

  CAUTIONARY AND ADVISORY LABELS 21, 25
  ▶ Tretinoin (Non-proprietary) Tretinoin 10 mg Tretinoin 10 mg capsules | 100 capsule | £240.00–£256.80

**RETINOID AND RELATED DRUGS**

Tretinoin

**INDICATIONS AND DOSE**

- Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

  BY MOUTH
  Child: (consult local protocol)

**CAUTIONS** Increased risk of thromboembolism during first month of treatment

**INTERACTIONS** → Appendix 1: retinoids

**SIDE-EFFECTS, FURTHER INFORMATION**

- Retinoic acid syndrome Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment - consult product literature.
- Nervous system effects Children particularly susceptible to nervous system effects.

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progesterone-only contraceptives not considered effective).

**PREGNANCY** Teratogenic. See Pregnancy and reproductive function in Cytotoxic drugs p. 505.

**BREAST FEEDING** Avoid (discontinue breast-feeding).

**HEPATIC IMPAIRMENT** Reduce dose - consult local treatment protocol for details.

**RENAL IMPAIRMENT** Reduce dose - consult local treatment protocol for details.

**MONITORING REQUIREMENTS** Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

**PRESCRIBING AND DISPENSING INFORMATION** Tretinoin is the acid form of vitamin A.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
- Capsule

  CAUTIONARY AND ADVISORY LABELS 21, 25
  ▶ Tretinoin (Non-proprietary) Tretinoin 10 mg Tretinoin 10 mg capsules | 100 capsule | £240.00–£256.80

**2.1 Cytotoxic drug-induced side effects**

**DETOXIFYING DRUGS** UROPROTECTIVE DRUGS

Mesna

**INDICATIONS AND DOSE**

- Urothelial toxicity following oxazaphosphorine therapy

  - BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION

  - Child: (consult local protocol)

**MUCOLYTIC IN CYSTIC FIBROSIS**

- BY INHALATION OF NEBULISED SOLUTION

  - Child: 3–6 mL twice daily, use a 20% solution

**UNLICENSED USE** Not licensed for use in children.

**SIDE-EFFECTS**

- Common or very common Colic - depression - diarrhoea - fatigue - headache - hypotension - irritability - joint pains - limb pains - nausea - rash - tachycardia - vomiting

- Rare Hypersensitivity reactions (more common in patients with auto-immune disorders)

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to thiol-containing compounds.
● PREGNANCY Not known to be harmful. See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

● DIRECTIONS FOR ADMINISTRATION For oral administration of the injection, contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ Mesna (Non-proprietary)
  Mesna 100 mg per 1 ml Mesna 1g/10ml solution for injection ampoules | 15 ampoule £41.15
  Mesna 400mg/4ml solution for injection ampoules | 5 ampoule £20.15
  no price available | 15 ampoule £210.15

VITAMINS AND TRACE ELEMENTS ▶ FOLATES

Folinic acid

● INDICATIONS AND DOSE
  Reduction of methotrexate-induced toxicity
  ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
  ▶ Child: (consult local protocol)
  Methotrexate overdose
  ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
  ▶ Child: (consult local protocol)
  Megaloblastic anaemia due to folate deficiency
  ▶ BY MOUTH
  ▶ Child 1 month–11 years: 250 micrograms/kg once daily
  ▶ Child 12-17 years: 15 mg once daily
  Metabolic disorders leading to folate deficiency
  ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
  ▶ Child: 15 mg once daily, larger doses may be required in older children
  Prevention of megaloblastic anaemia associated with pyrimethamine and sulfadiazine treatment of congenital toxoplasmosis
  ▶ BY MOUTH
  ▶ Neonate: 5 mg 3 times a week; increased if necessary up to 20 mg 3 times a week, if the patient is neutropenic.
  ▶ Child 1-11 months: 10 mg 3 times a week
  SODIOFOLIN®
  As an antidote to methotrexate
  ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
  ▶ Child: (consult product literature)

● UNLICENSED USE Consult product literature for licensing status of individual preparations.

● CONTRA-INDICATIONS Intrathecal injection

● CAUTIONS Avoid simultaneous administration of methotrexate - not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B12 deficiency

● INTERACTIONS ▶ Appendix 1: folates

● SIDE-EFFECTS
  ▶ Rare Agitation (after high doses) - depression (after high doses) - gastro-intestinal disturbances (after high doses) - insomnia (after high doses) - pyrexia (after parenteral use)

● PREGNANCY Not known to be harmful; benefit outweighs risk.

● BREAST FEEDING Presence in milk unknown but benefit outweighs risk.

● MEDICINAL FORMS
  Folinic acid (as Calcium folinate) 7.5 mg per 1 ml Calcium folinate 15mg/2ml solution for injection ampoules | 5 ampoule £39.00
  DT price = £39.00
  Folinic acid (as Calcium folinate) 10 mg per 1 ml Calcium folinate 50mg/5ml solution for injection vials | 1 vial £20.00 (Hospital only) | 1 vial £100.00
  Calcium folinate 300mg/30ml solution for injection vials | 1 vial £37.50 (Hospital only) | 1 vial £37.50
  Folinic acid (as Disodium folinate) 50 mg per 1 ml Disodium folinate 50mg/1ml solution for injection vials | 1 vial £24.70
  Disodium folinate 200mg/4ml solution for injection vials | 1 vial £80.40

  Sodiofolin 100mg/2ml solution for injection vials | 1 vial £35.09 (Hospital only)
  Tablet
  Folinic acid (Non-proprietary)
  Folinic acid (as Calcium folinate) 15 mg Calcium folinate 15mg tablets | 10 tablet £49.06 DT price = £49.05
  Refolinon (Pfizer Ltd)
  Folinic acid (as Calcium folinate) 15 mg Refolinon 15mg tablets | 30 tablet £85.74

Levofoinic acid

● DRUG ACTION Levofoinic acid is an isomer of folic acid.

● INDICATIONS AND DOSE
  Reduction of methotrexate-induced toxicity
  ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  ▶ Child: (consult local protocol)
  Methotrexate overdose
  ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
  ▶ Child: (consult local protocol)

● CONTRA-INDICATIONS Intrathecal injection

● CAUTIONS Avoid simultaneous administration of methotrexate - not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B12 deficiency

● INTERACTIONS ▶ Appendix 1: folates

● SIDE-EFFECTS
  ▶ Rare Agitation (after high doses) - depression (after high doses) - gastro-intestinal disturbances (after high doses) - insomnia (after high doses) - pyrexia (after parenteral use)

● PREGNANCY Not known to be harmful; benefit outweighs risk.

● BREAST FEEDING Presence in milk unknown but benefit outweighs risk.

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Solution for injection

▶ Isoverin (Pfizer Ltd)
  Levofoinic acid (as Calcium levofoinic) 10 mg per 1 ml Isoverin 175mg/17.5ml solution for injection vials | 1 vial £81.33 (Hospital only)
  Isoverin 25mg/2.5ml solution for injection vials | 1 vial £11.62 (Hospital only)
2.1a Hyperuricaemia associated with cytotoxic drugs

DETOXIFYING DRUGS > URATE OXIDASES

Rasburicase

- INDICATIONS AND DOSE
  - Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy
    - BY INTRAVENOUS INFUSION
      - Child: (consult local protocol)

- UNLICENSED USE Not licensed for use in children.
- CONTRA-INDICATIONS G6PD deficiency
- CAUTIONS Anaphylaxis
- SIDE-EFFECTS
  - Common or very common Fever, nausea, vomiting
  - Uncommon Anaphylaxis, bronchospasm, diarrhoea, haemolytic anaemia, headache, hypersensitivity reactions, methaemoglobinemia, rash
- PREGNANCY Manufacturer advises avoid—no information available.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- MONITORING REQUIREMENTS Monitor closely for hypersensitivity.
- EFFECT ON LABORATORY TESTS May interfere with test for uric acid—consult product literature.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Powder and solvent for solution for infusion
  - Fasturtec (Sanofi) Rasburicase 1.5 mg Fasturtec 1.5mg powder and solvent for solution for infusion vials | 3 vial POM £208.39 (Hospital only)
  - Rasburicase 7.5 mg Fasturicase 7.5mg powder and solvent for solution for infusion vials | 1 vial POM £347.32 (Hospital only)

XANTHINE OXIDASE INHIBITORS

Allopurinol

- INDICATIONS AND DOSE
  - Prophylaxis of hyperuricaemia associated with cancer chemotherapy | Prophylaxis of hyperuricaemic nephropathy, enzyme disorders causing increased serum urate e.g Lesch-Nyhan syndrome
    - BY MOUTH
      - Child 1 month-14 years: 10–20 mg/kg daily, dose to be taken preferably after food; maximum 400 mg per day
      - Child 15-17 years: Initially 100 mg daily, taken preferably after food; dose to be increased according to response, up to 900 mg daily in divided doses (max. per dose 300 mg)

- CAUTIONS Ensure adequate fluid intake • for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy
- INTERACTIONS > Appendix 1: allopurinol
- SIDE-EFFECTS
  - Common or very common Gastro-intestinal disorders, rashes (withdraw therapy; if rash mild re-introduce cautiously but discontinue immediately if recurrence)
  - Rare Alopecia, aplastic anaemia, arthralgia, blood disorders, drowsiness, eosinophilia, Stevens-Johnson syndrome, exfoliative dermatitis

epidermal necrosis • exfoliation • fever • haemolytic anaemia • headache • hepatitis • hepatotoxicity • hypersensitivity reactions • hypertension • leucopenia • lymphadenopathy • malaise • neuropathy • paraesthesia • renal impairment • taste disturbances • thrombocytopenia • vasculitis • vertigo • visual disturbances
  - Very rare Seizures
- PREGNANCY Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.
- BREAST FEEDING Present in milk—not known to be harmful.
- HEPATIC IMPAIRMENT Reduce dose. Monitor hepatic function.
- RENAL IMPAIRMENT Manufacturer advises reduce dose or increase dose interval in severe impairment; adjust dose to maintain plasma-oxypurinol concentration below 100 micromol/litre.
- PATIENT AND CARER ADVICE
  - Medicines for Children leaflet: Allopurinol for hyperuricaemia www.medicinesforchildren.org.uk/allopurinol-for-hyperuricaemia

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, mouthwash

Tablet
  CAUTIONARY AND ADVISORY LABELS 8, 21, 27
  - Allopurinol (Non-proprietary)
    - Allopurinol 100 mg Allopurinol 100mg tablets | 28 tablet Pom £8.15 DT price = £0.77
    - Allopurinol 300 mg Allopurinol 300mg tablets | 28 tablet Pom £5.85 DT price = £0.85
  - Urici (Ennogen Pharma Ltd)
    - Urici 100 mg Urici 100mg tablets | 28 tablet Pom £1.25 DT price = £0.77
    - Allopurinol 300 mg Urici 300mg tablets | 28 tablet Pom £0.94 DT price = £0.85
  - Zyloric (Aspen Pharma Trading Ltd)
    - Allopurinol 100 mg Zyloric 100mg tablets | 10 tablet Pom £10.19
    - Allopurinol 300 mg Zyloric 300mg tablets | 28 tablet Pom £7.31 DT price = £0.85

3  Immunotherapy responsive malignancy

IMMUNOSTIMULANTS > INTERFERONS

Interferon alfa

- DRUG ACTION Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

- INDICATIONS AND DOSE
  - Induction of early regression of life-threatening corticosteroid resistant haemangioma of infancy
    - BY SUBCUTANEOUS INJECTION
      - Child: (consult local protocol)

INTRONA® PEN

Chronic active hepatitis B
  - BY SUBCUTANEOUS INJECTION
    - Child 2-17 years: 5 000 000–10 000 000 units/m² 3 times a week

Chronic active hepatitis C (in combination with oral ribavirin)
  - BY SUBCUTANEOUS INJECTION
    - Child 3-17 years: 3 000 000 units/m² 3 times a week
**INTERACTIONS**

- **Appendix 1: interferons**

- **SIDE-EFFECTS**
  - Common or very common: Anorexia, influenza-like symptoms, lethargy, nausea
  - Rare: Pneumonia, pneumonitis, pulmonary infiltrates
  - Frequency not known: Alopecia, arthralgias, cardiovascular problems, coma, confusion, depression, hepatotoxicity, hyperglycaemia, hypersensitivity reactions, hypertension, hypothyroidism, myelosuppression (particularly affecting granulocyte counts), nephrotoxicity, ocular side-effects, psoriasisform rash, reversible motor problems in young children, seizures, suicidal behaviour, thyroid abnormalities

**SIDE-EFFECTS, FURTHER INFORMATION**

Consult product literature and local treatment protocols for information on side-effects. Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired, the discontinuation of interferon alfa should be considered.

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during treatment—consult product literature.

**PREGNANCY**

Avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING**

Unlikely to be harmful.

**HEPATIC IMPAIRMENT**

Avoid in severe hepatic impairment.

**RENAL IMPAIRMENT**

Avoid in severe renal impairment.

**MONITORING REQUIREMENTS**

- Monitoring of lipid concentration is recommended.
- Monitoring of hepatic function is recommended.

---

**INTERFERON GAMMA-1B**

(Immune interferon)

- **INDICATIONS AND DOSE**
  - To reduce the frequency of serious infection in chronic granulomatous disease
    - BY SUBCUTANEOUS INJECTION
      - Child 6 months–17 years (body surface area up to 0.6 m²): 1.5 micrograms/kg/3 times a week
      - Child 6 months–17 years (body surface area 0.6 m² and above): 50 micrograms/m²/3 times a week

- To reduce the frequency of serious infection in severe malignant osteopetrosis
  - BY SUBCUTANEOUS INJECTION
    - Child (body surface area up to 0.6 m²): 1.5 micrograms/kg/3 times a week
    - Child (body surface area 0.6 m² and above): 50 micrograms/m²/3 times a week

- **CONTRA-INDICATIONS**
  - Simultaneous administration of foreign proteins including immunological products (such as vaccines)–risk of exaggerated immune response

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, arthralgia, chills, depression, diarrhoea, fatigue, fever, headache, injection-site reactions, myalgia, nausea, rash, vomiting
  - Rare: Confusion, systemic lupus erythematosus

- **Frequency not known:** Neutropenia, proteinuria, raised liver enzymes, thrombocytopenia
Targeted therapy responsive malignancy

4 Targeted therapy responsive malignancy

Mifamurtide

- **INDICATIONS AND DOSE**
  - Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)
  - **BY INTRAVENOUS INFUSION**
  - Child 2–17 years: Infusion to be given over 1 hour (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in patients under 2 years of age at initial diagnosis.
- **CAUTIONS** Asthma—consider prophylactic bronchodilator therapy—chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy—history of autoimmune disease—history of collagen disease—history of inflammatory disease
- **INTERACTIONS** → Appendix 1: mifamurtide
- **SIDE-EFFECTS** Abdominal pain, alopecia, anaemia, anorexia, anxiety, blurred vision, confusion, constipation, cough, depression, diarrhoea, dizziness, drowsiness, dry skin, dyspepsia, dyspnoea, dysuria, epistaxis, flushing, gastro-intestinal disturbances, granulocytopenia, haematuria, haemoptysis, headache, hearing loss, hypertension, hypoaesthesia, hypokalaemia, hypotension, insomnìa, leucopenia, muscular-skeletal pain, nausea, oedema, palpitations, paraesthesia, phlebitis, pleural effusion, poliakuria, rash, respiratory disorders, sweating, tachycardia, tachyphœna, thrombocytopenia, tinnitus, tremor, vertigo, vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution—no information available.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **MONITORING REQUIREMENTS** Monitor renal function, hepatic function and clotting parameters.

- **MEDICINAL FORMS** Solution for injection
  - **Immukin** (Boehringer Ingelheim Ltd)
  - Interferon gamma-1b (recombinant human) 200 microgram per 1 ml Immukin 100micrograms/0.5ml solution for injection vials | 6 vial £450.00

Everolimus

- **DRUG ACTION** Everolimus is a protein kinase inhibitor.

- **INDICATIONS AND DOSE**
  - **VOTUBIA® DISPERSIBLE TABLETS**
    - Subependymal giant cell astrocytoma associated with tuberous sclerosis complex
    - **BY MOUTH USING DISPERSIBLE TABLETS**
    - Child 1-17 years: (consult product literature)
    - Adjunctive treatment of refractory partial-onset seizures, with or without secondary generalisation, associated with tuberous sclerosis complex
    - **BY MOUTH USING DISPERSIBLE TABLETS**
    - Child 2-17 years: (consult product literature)
    - **VOTUBIA® TABLETS**
      - Subependymal giant cell astrocytoma associated with tuberous sclerosis complex
      - **BY MOUTH USING TABLETS**
      - Child 1-17 years: (consult product literature)

- **IMPORTANT SAFETY INFORMATION**
  - Risks of incorrect dosing of oral anti-cancer medicines
  - See Cytotoxic drugs p. 505.

- **CAUTIONS** History of bleeding disorders
- **INTERACTIONS** → Appendix 1: everolimus
- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, anorexia, arthralgia, asthenia, chest pain, convulsions, dehydration, diarrhoea, dry mouth, dysphagia, electrolyte disturbance, epistaxis, eyelid oedema, fatigue, hand-foot syndrome, headache, hypercholesterolaemia, hyperglycaemia, hyperlipidaemia, hypertension, hypoglycaemia, increased susceptibility to aspergillosis, increased susceptibility to candidiasis, increased...
susceptibility to infections • increased susceptibility to pneumonia • insomnia • interstitial lung disease • irritability • nail disorders • peripheral oedema • pneumonitis • renal failure • skin disorders • taste disturbance

- **Uncommon** Aggression • agitation • congestive heart failure • flushing • impaired wound healing • rhabdomyolysis
- **Frequency not known** Alopecia • bone-marrow suppression • gastro-intestinal effects • haemorrhage • hepatitis B reactivation • hyperuricaemia • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • thrombocytopenia • tumour lysis syndrome • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
Reduce dose or discontinue if severe side-effects occur—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for up to 8 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in hepatitis B infection).
- **HEPATITIS B INFECTION** Imatinib is a tyrosine kinase inhibitor.
- **Targeted therapy responsive malignancy** Child:

---

**DIRECTIONS FOR ADMINISTRATION**

**VOTUBIA® DISPERSE TABLETS** Manufacturer advises tablets must be dispersed in water before administration—consult product literature for details.

**VOTUBIA® TABLETS** Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

**PRESCRIBING AND DISPENSING INFORMATION** Votubia® is available as both tablets and dispersible tablets. These formulations vary in their licensed indications and are not interchangeable—consult product literature for information on switching between formulations.

**PATIENT AND CARER ADVICE**
Pneumonitis. Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Dispersible tablet**

**CAUTIONARY AND ADVISORY LABELS** 13

- **Votubia® (Novartis Pharmaceuticals UK Ltd)**
  - Everolimus 2 mg Votubia 2mg dispersible tablets sugar-free | 30 tablet <POT> £69.00
  - Everolimus 3 mg Votubia 3mg dispersible tablets sugar-free | 30 tablet <POT> £144.00
  - Everolimus 5 mg Votubia 5mg dispersible tablets sugar-free | 30 tablet <POT> £225.00

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 25

- **Votubia® (Novartis Pharmaceuticals UK Ltd)**
  - Everolimus 2.5 mg Votubia 2.5mg tablets | 30 tablet <POT> £120.00
  - Everolimus 5 mg Votubia 5mg tablets | 30 tablet <POT> £225.00
  - Everolimus 10 mg Votubia 10mg tablets | 30 tablet <POT> £297.00

---

**INDICATIONS AND DOSE**
Treatment of newly diagnosed Philadelphia-chromosome-positive chronic myeloid leukaemia when bone marrow transplantation is not considered first line treatment | Treatment of Philadelphia-chromosome-positive chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis | Treatment of newly diagnosed Philadelphia-chromosome-positive acute lymphoblastic leukaemia in combination with chemotherapy

- **BY MOUTH**
  - Child: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**
See Cytotoxic drugs p. 505.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**
An EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

**CAUTIONS** Cardiac disease • hepatitis B infection • history of renal failure • risk factors for heart failure

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain • appetite changes • arthralgia • ascites • conjunctivitis • constipation • cough • cramps • diarrhoea • dizziness • dry eyes • dry mouth • dry skin • dyspnoea • epistaxis • fatigue • flatulence • flushing • gastro-oesophageal reflux • haemorrhage • headache • hypoaesthesia • increased lacrimation • influenza-like symptoms • insomnia • oedema • paraesthesia • photosensitivity • pleural effusion • pruritus • pulmonary oedema • rash • sweating • taste disturbance • visual disturbances • weight changes
- **Uncommon** Acute respiratory failure • anxiety • cold extremities • cough • depression • drowsiness • dysphagia • electrolyte disturbances • gastric ulceration • gout • gynaecomastia • haematomata • hearing loss • heart failure • hepatic dysfunction • hepatitis • hypertension • hypotension • impaired memory • irregular menstruation • menorrhagia • migraine • palpitation • pancreatitis • peripheral neuropathy • renal failure • sexual dysfunction • skin hyperpigmentation • syncope • tachycardia • tinnitus • tremor • urinary frequency • vertigo
- **Rare** Angina • angioedema • arthralgia • aseptic necrosis of bone • atrial fibrillation • cataract • confusion • convulsions • exfoliative dermatitis • gastro-intestinal perforation • glaucoma • haemolytic anaemia • hepatic failure • hepatic failure (fatal cases reported) • hepatic necrosis • increased intracranial pressure • inflammatory bowel disease • intestinal obstruction • myocardial infarction • myopathy • pulmonary fibrosis • pulmonary hypertension • rhabdomyolysis • Stevens-Johnson syndrome
- **Frequency not known** Alopecia • bone-marrow suppression • drug rash with eosinophilia and systemic symptoms
(DRESS) · gastrointestinal effects · growth retardation in children · hepatitis B reactivation · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

CONCEPTION AND CONTRACEPTION Effective contraception required during treatment.

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs p. 505.

BREAST FEEDING Discontinue breast-feeding.

HEPATIC IMPAIRMENT Start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol.

RENAL IMPAIRMENT Start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol.

MONITORING REQUIREMENTS
▶ Monitor for gastrointestinal haemorrhage.
▶ Monitor complete blood counts regularly.
▶ Monitor for fluid retention.
▶ Monitor liver function.
▶ Monitor growth in children (may cause growth retardation).

DIRECTIONS FOR ADMINISTRATION Tablets may be dispersed in water or apple juice.

PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer imatinib tablets.

MEDICATION FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 27

Imatinib (as imatinib mesilate) 100 mg
Imatinib 100mg tablets | 30 tablet [POM] £486.66 | 60 tablet [POM] £999.99–£973.32

Blood and blood-forming organs

1 Anaemias

Anaemias

Initiation of treatment
Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia
Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxychloroquine p. 524 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxychloroquine may not become evident for several months.

G6PD deficiency
Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, Vicia faba); this is termed favism and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies;
thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
• manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
• the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD-deficient individuals available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

**Drugs with definite risk of haemolysis in most G6PD-deficient individuals**
- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Methylene blue chloride
- Nifedipine [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

**Drugs with possible risk of haemolysis in some G6PD-deficient individuals**
- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfonyleureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

**Drugs used in hypoplastic, haemolytic, and renal anaemias**

**Anabolics** 
- **Oxymetholone**
  - **INDICATIONS AND DOSE**
    - Aplastic anaemia
      - **BY MOUTH**
        - **Child:** 1–5 mg/kg daily for 3 to 6 months
  - **INTERACTIONS**
    - Appendix 1: oxymetholone
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
      - **Capsule**
        - Oxymetholone (Non-proprietary)
  - **EPOETINS**
  - **IMPORTANT SAFETY INFORMATION**

**Erythropoietins**

Epoetins (recombimant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure.

Epoetin beta p. 538 is also used for the prevention of anaemia in preterm neonates of low birth-weight; a therapeutic response may take several weeks.

There is insufficient information to support the use of erythropoietins in children with leukaemia or in those receiving cancer chemotherapy.

Darbepoetin is a glycosylated derivative of epoetin; it persists longer in the body and can be administered less frequently than epoetin.

### 1.1 Hypoplastic, haemolytic, and renal anaemias

**ANABOLIC STEROIDS**

**ANDROSTAN DERIVATIVES**

**Oxymetholone**
erythropoietins in those with chronic kidney disease may increase the risk of serious cardiovascular events and death; haemoglobin concentrations higher than 12 g/100 mL should be avoided in children.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates - pure red cell aplasia following erythropoietin therapy - uncontrolled hypertension

- **CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) - concurrent infection (can impair the response to erythropoietin) - correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment - during dialysis (increase in unfractonated or low molecular weight heparin dose may be needed) - epilepsy - inadequately treated or poorly controlled blood pressure - interrupt treatment if blood pressure uncontrolled - ischaemic vascular disease - malignant disease - other inflammatory disease (can impair the response to erythropoietin) - sickle-cell disease (lower target haemoglobin concentration may be appropriate) - sudden stabbing migraine-like pain (warning of a hypertensive crisis) - thrombocytosis (monitor platelet count for first 8 weeks)

- **SIDE-EFFECTS**
  - **Common or very common** Aggravation of hypertension (dose-dependent) - cardiovascular events - diarrhoea - dose-dependent increase in platelet count regressing during treatment (but thrombocytosis rare) - headache - hypertensive crisis (isolated patients with normal or low blood pressure) - increase in blood pressure (dose-dependent) - influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes) - nausea - shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications - vomiting
  - **Very rare** Sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure
  - **Frequency not known** Anaphylaxis - angioedema - hyperkalaemia - hypersensitivity reactions - injection-site reactions - peripheral oedema - skin reactions

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Hypertensive crisis** In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.
  - Pure red cell aplasia There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

- **MONITORING REQUIREMENTS**
  - Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes - interrupt treatment if blood pressure uncontrolled.
  - Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients and in preterm neonates.

- **INTERACTIONS** → Appendix 1: darbepoetin alfa

- **SIDE-EFFECTS** Injection-site pain - oedema

- **PREGNANCY** No evidence of harm in animal studies - manufacturer advises caution.

- **BREAST FEEDING** Manufacturer advises avoid - no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

# Darbepoetin alfa

- **INDICATIONS AND DOSE**
  - **Symptomatic anaemia associated with chronic renal failure in patients on dialysis**
    - BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
      - Child 11–17 years: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

- **Symptomatic anaemia associated with chronic renal failure in patients not on dialysis**
  - BY SUBCUTANEOUS INJECTION
    - Child 11–17 years: Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

- **Symptomatic anaemia associated with chronic renal failure in patients not on dialysis**
  - BY INTRAVENOUS INJECTION
    - Child 11–17 years: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks, or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

**Epoetin beta**

- **INDICATIONS AND DOSE**
  - **Symptomatic anaemia associated with chronic renal failure**
    - **BY SUBCUTANEOUS INJECTION**
      - Neonate: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.
      - Child: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.
    - **BY INTRAVENOUS INJECTION**
      - Neonate: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.
      - Child: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.
Epoetin zeta

1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

**Eculizumab**

- **DRUG ACTION** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

- **INDICATIONS AND DOSE**
  - **By intravenous infusion**
    - Child: Refer for specialist advice, experience very limited

  Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)

  Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)

- **UNLICENSED USE** Not licensed for use in children for paroxysmal nocturnal haemoglobinuria.

- **CONTRA-INDICATIONS** Patients unvaccinated against *Neisseria meningitidis* unresolved *Neisseria meningitidis* infection

- **CAUTIONS** Active systemic infection

**CAUTIONS, FURTHER INFORMATION**

- Meningococcal infection Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunizations should also be up to date.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**
  - Common or very common Alopecia - arthralgia - blood disorders - cough - dizziness - dysgeusia - dysuria - fatigue - gastro-intestinal disturbances - headache - infection

(including meningococcal infection) - influenza-like symptoms - infection-related reactions - leucopenia - myalgia - nasopharyngitis - oedema - paraesthesia - pruritus - rash - spontaneous erection - thrombocytopения - vertigo

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 5 months after treatment.

- **PREGNANCY** No information available—use only if potential benefit outweighs risk. Human IgG antibodies known to cross placenta.

- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.

- **MONITORING REQUIREMENTS**
  - Monitor for 1 hour after infusion.
  - For *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.

  - For *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.

- **DIRECTIONS FOR ADMINISTRATION** Dilute requisite dose to a concentration of 5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and mix gently; give over 25–45 minutes. If infusion-related reactions occur, infusion time may be increased to 4 hours in child under 12 years or 2 hours in child over 12 years.

- **PRESCRIBING AND DISPENSING INFORMATION** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.

- **PATIENT AND CARER ADVICE** A patient information card should be provided.

  - Patient or carers should be advised to report promptly any signs of meningococcal infection.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**ELECTROLYTES:** May contain Sodium

- **Soliris** (Alexion Pharma UK Ltd)
  - **Eculizumab 10 mg per 1 ml** Soliris 300mg/30ml concentrate for solution for infusion vials | 1 vial £3,150.00 (Hospital only)

---

### 1.2 Iron deficiency anaemia

**Anaemia, iron deficiency**

**Treatment and prophylaxis**

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastro-intestinal bleeding). The possibility of thalassaemia should be considered in children of Mediterranean or Indian subcontinent descent.
Prophylaxis with an iron preparation may be appropriate in those with a poor diet, malabsorption, menorrhagia, pregnancy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

**Oral iron**

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by formulation, palatability, incidence of side-effects, and cost.

**Treatment of iron-deficiency anaemia**

The oral dose of elemental iron to treat deficieny is 3–6 mg/kg (max. 200 mg) daily given in 2–3 divided doses. Iron supplementation may also be required to produce an optimum response to erythropoietins in iron-deficient children with chronic renal failure or in preterm neonates.

When prescribing, express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered.

Prophylaxis of iron deficiency

In neonates, haemoglobin and haematocrit concentrations change rapidly. These changes are not due to iron deficiency and cannot be corrected by iron supplementation. Similarly, neonatal anaemia resulting from repeated blood sampling does not respond to iron therapy.

All babies, including preterm neonates, are born with substantial iron stores but these stores can become depleted unless dietary intake is adequate. All babies require an iron intake of 400–700 nanograms daily to maintain body stores. Iron in breast milk is well absorbed but that in artificial feeds or in cow’s milk is less so. Most artificial formula feeds are sufficiently fortified with iron to prevent deficiency and their iron content should be taken into account when considering further iron supplementation.

Prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

Infants with a poor diet may become anaemic in the second year of life, particularly if cow’s milk, rather than fortified formula feed, is a major part of the diet.

**Compound preparations**

Some oral preparations contain ascorbic acid p. 602 to aid absorption of the iron, but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins, except folic acid p. 546 for pregnant women.

Parenteral iron

Iron can be administered parenterally as iron dextran p. 542, iron sucrose p. 542 or ferric carboxymaltose p. 542.

Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the child cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption.

Many children with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of children with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the child’s body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

**MINERALS AND TRACE ELEMENTS**

IRON, INJECTABLE

**Iron (injectable)**

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

**SIDE-EFFECTS**

Hypersensitivity reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

Anaphylactic reactions Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available. If children complain of acute symptoms particularly nausea, back pain, breathlessness, or develop hypotension, the infusion should be stopped.

**Overdose**

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 803.
**Ferric carboxymaltose**

- **INDICATIONS AND DOSE**
  - **Iron-deficiency anaemia**
    - **By slow intravenous injection, or by intravenous infusion**
    - Child: Dose calculated according to body-weight and iron deficit (consult product literature)

- **UNLICENSED USE**
  - Not licensed for use in children under 14 years.

- **CAUTIONS**
  - Allergic disorders, asthma, eczema, hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available. Infection (discontinue if ongoing bacteremia). Oral iron should not be given until 5 days after last injection.

- **INTERACTIONS**
  - Appendix 1: iron (injectable)

- **SIDE-EFFECTS**
  - **Common or very common**
    - Dizziness, gastrointestinal disturbances, headache, injection-site reactions, rash
  - **Uncommon**
    - Anaphylaxis, arthralgia, back pain, chest pain, fatigue, flushing, hypertension, hypotension, malaise, myalgia, paraesthesia, peripheral oedema, pruritus, pyrexia, rigors, urticaria
  - **Rare**
    - Dyspnoea
  - **Pregnancy**
    - Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.
  - **Hepatic impairment**
    - Use with caution. Avoid in conditions where iron overload increases risk of impairment.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - **Electrolytes**: May contain Sodium
  - **Ferinject** (Vifor Pharma UK Ltd)
    - **Iron (as Ferric carboxymaltose) 50 mg per 1 ml**
      - Ferinject 1000mg/20ml solution for injection vials | 1 vial | £154.23
      - Ferinject 100mg/2ml solution for injection vials | 5 vial | £81.18
      - Ferinject 500mg/10ml solution for injection vials | 5 vial | £405.88

**Iron dextran**

- **INDICATIONS AND DOSE**
  - **Iron-deficiency anaemia**
    - **By deep intramuscular injection**
      - Child 14–17 years: Intramuscular injection to be administered into the gluteal muscle, doses calculated according to body-weight and iron deficit (consult product literature)
    - **By slow intravenous injection, or by intravenous infusion**
      - Child: Doses calculated according to body-weight and iron deficit (consult product literature)

- **UNLICENSED USE**
  - Not licensed for use in children under 14 years.

- **CONTRA-INDICATIONS**
  - Active rheumatoid arthritis, asthma, eczema, history of allergic disorders, infection

- **CAUTIONS**
  - Hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available. Oral iron should not be given until 5 days after last injection.

- **INTERACTIONS**
  - Appendix 1: iron (injectable)

- **SIDE-EFFECTS**
  - **Common or very common**
    - Taste disturbances
  - **Uncommon**
    - Abdominal pain, bronchospasm, chest pain, diarrhea, dizziness, dyspnoea, fever, flushing, headache, hypotension, injection-site reactions, malaise, myalgia, nausea, palpititation, pruritus, rash, tachycardia, vomiting
  - **Rare**
    - Anaphylaxis, asthenia, fatigue, hypertension, paraesthesia, peripheral oedema
  - **Frequency not known**
    - Arthralgia, bradycardia, confusion, increased sweating

- **Pregnancy**
  - Avoid in first trimester.

- **Hepatic Impairment**
  - Use with caution. Avoid in conditions where iron overload increases risk of impairment.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron.

**Iron sucrose**

- **INDICATIONS AND DOSE**
  - **Iron-deficiency anaemia**
    - **By slow intravenous injection, or by intravenous infusion**
      - Child (body-weight up to 67 kg): Dose calculated according to body-weight and iron deficit, each divided dose should not exceed 3 mg/kg/dose (consult product literature)
      - Child (body-weight 67 kg and above): Dose calculated according to body-weight and iron deficit, each divided dose should not exceed max. 200 mg/dose (consult product literature)

- **UNLICENSED USE**
  - Not licensed for use in children.

- **CONTRA-INDICATIONS**
  - Anaphylaxis, asthma, eczema, history of allergic disorders

- **CAUTIONS**
  - Hypersensitivity reactions can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available. Infection (discontinue if ongoing bacteremia). Oral iron should not be given until 5 days after last injection.

- **INTERACTIONS**
  - Appendix 1: iron (injectable)

- **SIDE-EFFECTS**
  - **Common or very common**
    - Taste disturbances
  - **Uncommon**
    - Abdominal pain, bronchospasm, chest pain, diarrhea, dizziness, dyspnoea, fever, flushing, headache, hypotension, injection-site reactions, malaise, myalgia, restlessness, seizures, sweating, tachycardia, tremor
  - **Rare**
    - Angioedema, arthralgia, chest pain, diarrhea, dizziness, fatigue, hypotension, impaired consciousness, injection-site reactions, myalgia, restlessness, seizures, sweating, tachycardia, tremor
  - **Very rare**
    - Haemolysis, headache, hypertension, palpitation, paraesthesia, transient deafness

- **Pregnancy**
  - Avoid in first trimester.

- **Hepatic Impairment**
  - Avoid in severe impairment.

- **Renal Impairment**
  - Avoid in acute renal failure.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron.
Iron (oral)

**SIDE-EFFECTS**
Constipation, diarrhea, epigastric pain (dose related), faecal impaction, gastro-intestinal irritation, nausea (dose related)

**SIDE-EFFECTS, FURTHER INFORMATION**
- Managing side-effects: If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulfate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.
- Altered bowel habit: Iron preparations taken orally can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease. The relationship between dose and altered bowel habit (constipation or diarrhea) is less clear than for nausea and epigastric pain.

**OVERDOSE**
For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 803.

Iron preparations are an important cause of accidental overdose in children and as little as 20 mg/kg of elemental iron can lead to symptoms of toxicity.

**MONITORING REQUIREMENTS**
- Therapeutic response: The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

**PRESCRIBING AND DISPENSING INFORMATION**
Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription.

- The iron content of artificial formula feeds should also be considered.
- The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

**PATIENT AND CARER ADVICE**
- Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

**Ferrous fumarate**

**INDICATIONS AND DOSE**

- **Iron-deficiency anaemia (prophylactic)**
  - By Mouth using Tablets
  - Child 12-17 years: 210 mg 1–2 times a day
  - By Mouth using Syrup
  - Child 12-17 years: 322 mg daily

**Iron-deficiency anaemia (therapeutic)**

- By Mouth using Tables
- Child 12-17 years: 210 mg 2–3 times a day
- By Mouth using Syrup
- Child 12-17 years: 280 mg twice daily

**FERSADAY®**

- Iron-deficiency anaemia (prophylactic)
  - By Mouth
  - Child 12-17 years: 322 mg daily

- Iron-deficiency anaemia (therapeutic)
  - By Mouth
  - Child 12-17 years: 305 mg daily

**GALFER® capsules**

- Iron-deficiency anaemia (prophylactic)
  - By Mouth
  - Child 12-17 years: 305 mg twice daily

- Iron-deficiency anaemia (therapeutic)
  - By Mouth
  - Child 12-17 years: 305 mg twice daily

**GALFER® syrup**

- Iron-deficiency anaemia (prophylaxis)
  - By Mouth
  - Neonate or 17 weeks corrected gestational age (body-weight up to 3 kg): 0.5 mL daily, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.
  - Neonate: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.
  - Child 1 month–1 year: 0.25 mL/kilogram twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established; maximum 20 mL per day.
  - Child 12-17 years: 10 mL 1–2 times a day

**INTERACTIONS**
- Appendix 1: Iron (oral)

**PRESCRIBING AND DISPENSING INFORMATION**
Non-proprietary ferrous fumarate tablets may contain 210 mg (68 mg iron), syrup may contain approx. 140 mg (45 mg iron)/5 mL; Galfer® capsules contain ferrous fumarate 305 mg (100 mg iron); Fersaday® tablets contain ferrous fumarate 322 mg (100 mg iron).

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Ferrous fumarate for iron-deficiency anaemia www.medicinesforchildren.org.uk/ferrous-fumarate-for-iron-deficiency-anaemia

**Ferrous sulfate with folic acid**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ferrous sulfate above, folate acid p. 546.

**INDICATIONS AND DOSE**

**Iron-deficiency anaemia**
- **BY MOUTH USING MODIFIED-RELEASE TABLETS**
  - Child 12-17 years: 1 tablet daily, to be taken before food

**INTERACTIONS** → Appendix 1: folates, iron (oral)

**LESS SUITABLE FOR PRESCRIBING** FerroGrad Folic® is less suitable for prescribing.
1.3 Megaloblastic anaemia

Anaemia, megaloblastic

Overview

Megaloblastic anaemias are rare in children; they may result from a lack of either vitamin B₁₂ or folate and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

Vitamin B₁₂ is used in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare disorders of congenital transcobalamin II deficiency and homocystinuria.

Vitamin B₁₂ should be given prophylactically after total ileal resection.

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂, in large oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 547 has completely replaced
cyanocobalamin p. 547 as the form of vitamin B₃₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₃₂ neuropathy.

Folic acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₃₂ is administered concurrently otherwise neuropathy may be precipitated.

In folate-deficient megaloblastic anaemia (e.g., because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores; higher doses may be necessary in malabsorption states. In pregnancy, folic acid daily is continued to term.

For prophylaxis in chronic haemolytic states, malabsorption, or in renal dialysis, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in juvenile idiopathic arthritis, severe Crohn’s disease and severe psoriasis.

Folic acid is actively excreted in breast milk and is well absorbed by the infant. It is also present in cow’s milk and artificial formula feeds but is heat labile. Serum and red cell folate concentrations fall after delivery and urinary losses are high, particularly in low birth-weight neonates. Although symptomatic deficiency is rare in the absence of malabsorption or prolonged diarrhoea, it is common for neonatal units to give supplements of folic acid to all preterm neonates from 2 weeks of age until full-term corrected age is reached, particularly if heated breast milk is used without an artificial formula fortifier.

Folinic acid p. 528 is also effective in the treatment of folic deficient megaloblastic anaemia but it is normally only used in association with cytotoxic drugs; it is given as micrograms once daily.

There is no justification for prescribing multiple ingredient vitamin preparations containing vitamin B₃₂ or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 610.

### Folic acid

#### INDICATIONS AND DOSE

- **Folate-deficient megaloblastic anaemia**
  - **BY MOUTH**
  - Neonate: Initially 500 micrograms/kg once daily for up to 4 months.
  - Child 1–11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
  - Child 1–17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

- **Folate supplementation in neonates**
  - **BY MOUTH**
  - Neonate: 50 micrograms once daily.

#### PATIENT AND CARER ADVICE

- **UNLICENSED USE** Unlicensed for limiting methotrexate toxicity.
- **CAUTIONS** Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)
- **INTERACTIONS** → Appendix 1: folates
- **SIDE-EFFECTS**
  - Rare Gastro-intestinal disturbances
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### TABLET

- **Folic acid (Non-proprietary)**
  - Folic acid 400 microgram
  - Folic acid 400μg tablets | 90 tablet [P](P) no price available DT price = £2.71
  - Folic acid 5 mg
  - Folic acid 5mg tablets | 28 tablet [P](P) £1.17 DT price = £0.90 | 1000 tablet [P](P) £22.14
Oral solution
- Folic acid (Non-proprietary)
  - Folic acid 500 microgram per 1 ml Folic acid 2.5mg/5ml oral solution sugar free sugar-free | 150 ml Pom £9.16 DT price = £9.16 sugar-free | 150 ml £9.16 DT price = £9.16
  - Folic acid 1 mg per 1 ml Folic acid 5mg/5ml oral solution sugar free sugar-free | 150 ml Pom £13.74
  - Lexpec (Rosemont Pharmaceuticals Ltd)
    - Folic acid 500 microgram per 1 ml Lexpec Folic Acid 2.5mg/5ml oral solution sugar-free | 150 ml Pom £9.16 DT price = £9.16

VITAMINS AND TRACE ELEMENTS VITAMIN B GROUP

Cyanocobalamin

- INDICATIONS AND DOSE
  - Vitamin B<sub>12</sub> deficiency of dietary origin
    - BY MOUTH
    - Child: 50–105 micrograms daily in 1–3 divided doses

- PRESCRIBING AND DISPENSING INFORMATION
  The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied.
  Currently available brands of the tablet may not be suitable for vegans.
- NATIONAL FUNDING/ACCESS DECISIONS
  NHS restrictions Cyanocobalamin liquid, Cytacon® tablets, and Cytamen® injection are not available on prescription under the NHS.
- LESS SUITABLE FOR PRESCRIBING
  Cyanocobalamin is less suitable for prescribing.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet
  - Cyanocobalamin (Non-proprietary)
    - Cyanocobalamin 50 microgram Cyanocobalamin 50microgram tablets | 50 tablet Pom £6.24 DT price = £8.99 | 50 tablet £8.99 DT price = £8.99 | 100 tablet no price available
    - Cyanocobalamin 100 microgram Vitamin B12 100microgram tablets | 100 tablet £3.88
    - Cytacon (AMCo)
      - Cyanocobalamin 50 microgram Cytacon 50microgram tablets | 50 tablet Pom £8.99 DT price = £8.99
  - Oral solution
    - Cyanocobalamin (Non-proprietary)
      - Cyanocobalamin 7 microgram per 1 ml Cyanocobalamin 35micrograms/5ml oral solution | 200 ml Pom £8.75

Hydroxocobalamin

- INDICATIONS AND DOSE
  - Macrocytic anaemia without neurological involvement
    - BY INTRAMUSCULAR INJECTION
      - Child: Initially 0.25–1 mg 3 times a week for 2 weeks, then 0.25 mg once weekly until blood count normal, then 1 mg every 3 months
  - Macrocytic anaemia with neurological involvement
    - BY INTRAMUSCULAR INJECTION
      - Child: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months
  - Prophylaxis of macrocytic anaemias associated with vitamin B<sub>12</sub> deficiency
    - BY INTRAMUSCULAR INJECTION
      - Child: 1 mg every 2–3 months

Leber’s optic atrophy
- BY INTRAMUSCULAR INJECTION
  - Child: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

Congenital transcobalamin II deficiency
- BY INTRAMUSCULAR INJECTION
  - Neonate: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate.
  - Child: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate

Methylmalonic acidemia and homocystinuria
- BY INTRAMUSCULAR INJECTION
  - Child: Initially 1 mg daily for 5–7 days, then adjusted according to response to up to 1 mg 1–2 times a week, this is the maintenance dose

Methylmalonic acidemia, maintenance once intramuscular response established
- BY MOUTH
  - Child: 5–10 mg 1–2 times a week, some children do not respond to oral route

CYANOKIT®

Poisoning with cyanides
- BY INTRAVENOUS INFUSION
  - Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

- UNLICENSED USE
  - With intramuscular use or oral use Licensed for use in children (age not specified by manufacturers). Not licensed for use in inborn errors of metabolism.

- CAUTIONS
  - With intramuscular use or oral use Should not be given before diagnosis fully established

- SIDE-EFFECTS
  - GENERAL SIDE-EFFECTS
    - Dizziness • headache • pruritus
  - SPECIFIC SIDE-EFFECTS
    - With intramuscular use Hypokalaemia (during initial treatment) • injection-site reactions • rash • thrombocytosis (during initial treatment)
    - With intramuscular use or oral use Chromatonia • fever • hypersensitivity reactions • nausea
    - With intravenous use Dyspnoea • eye disorders • gastrointestinal disturbances • hot flush • lymphocytopenia • memory impairment • peripheral oedema • pustular rashes • red coloration of urine • restlessness • reversible red coloration of skin and mucous membranes • throat disorders • transient hypertension

- BREAST FEEDING
  - Present in milk but not known to be harmful.

- EFFECT ON LABORATORY TESTS
  - With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.

- DIRECTIONS FOR ADMINISTRATION
  - With intravenous use For intravenous infusion (Cyanokit®), given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).
  - With oral use For administration by mouth, injection solution may be given orally; it will not have prolonged effect via this route.
Iron overload

Overview
Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially thalassaemia major, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, and in thalassaemia, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 550 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is not added to the blood and is not given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by ascorbic acid (vitamin C) p. 602 daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to children with cardiac dysfunction; in children with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

Antidotes and chelators

Deferasirox

Drug action
Deferasirox, is an oral iron chelator.

Indications and dose
Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

By mouth using dispersible tablets
Child 2-5 years: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 mg/kg

Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

By mouth using dispersible tablets
Child 6-17 years: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 mg/kg

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)

By mouth using dispersible tablets
Child 2-5 years: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 mg/kg

Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

By mouth using dispersible tablets
Child 10-17 years: Initially 10 mg/kg once daily, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 10 mg/kg per day

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

By mouth using film-coated tablets
Child 2-5 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to...
Iron overload 549

Blood and nutrition

BNFC 2017–2018

serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)

- By mouth using film-coated tablets
  - Child 6-17 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Transfusion-related chronic iron overload when deferasiroxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only)

- By mouth using film-coated tablets
  - Child 6-17 years: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

Chronic iron overload when deferasiroxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)

- By mouth using film-coated tablets
  - Child 10-17 years: Initially 7 mg/kg once daily, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 7 mg/kg per day

Dose equivalence and conversion
- The bioavailability of dispersible tablets is lower than that of film-coated tablets; dispersible tablets are not interchangeable with film-coated tablets on a milligram-for-milligram basis—consult product literature for information on switching between formulations.

Caution: History of liver cirrhosis not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes). Platelet count less than 50x10^9/litre. Risk of gastro-intestinal ulceration and haemorrhage. Unexplained cytopenia—consider treatment interruption.

Interactions

- Appendix 1: deferasirox

Side-effects

- Rare Oesophagitis. Optic neuritis

Pregnancy

Manufacturer advises avoid unless essential—toxicity in animal studies.

Breastfeeding

Manufacturer advises avoid—present in milk in animal studies.

Hepatic impairment

Use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose. Avoid in severe impairment.

Renal impairment

Manufacturer advises reduce dose if serum-creatinine increased above age-appropriate limits or creatinine clearance less than 90 mL/minute on 2 consecutive occasions—consult product literature. Manufacturer advises avoid if estimated creatinine clearance less than 60 mL/minute.

Monitoring requirements

- Manufacturer advises monitoring of the following parameters: baseline serum creatinine twice and creatinine clearance once before initiation of treatment, weekly in the first month after treatment initiation or modification, then monthly thereafter; proteinuria before treatment initiation then monthly thereafter, and other markers of renal tubular function as needed; liver function before treatment initiation, every 2 weeks during the first month of treatment, then monthly thereafter; eye and ear examinations before treatment and annually during treatment; serum-ferritin concentration monthly.

Directions for administration

For dispersible tablets, manufacturer advises tablets should be dispersed in 100–200 mL of water, orange juice, or apple juice; if necessary any residue should be resuspended in a small volume of water or juice then administered; do not chew or swallow whole. For film-coated tablets, manufacturer advises tablets may be crushed and sprinkled on to soft food (yoghurt or apple sauce), then administered immediately.

Patient and carer advice

Patient or carers should be given advice on how to administer deferasirox dispersible tablets. Medicines for Children leaflet: Deferasirox for removing excess iron. www.medicinesforchildren.org.uk/deferasirox-for-removing-excess-iron

National funding/access decisions

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

The Scottish Medicines Consortium has advised (January 2017) that deferasirox (Exjade ®) is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload due to blood transfusions when deferoxamine treatment is contra-indicated or inadequate, in adult and paediatric patients aged 2 years and older with rare acquired or inherited anaemias. This advice relates only for use in patients with myelodysplastic syndrome with an International Prognostic Scoring System score of low or intermediate -1 risk.
Iron overload

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Dispersible tablet**

**CAUTIONARY AND ADVISORY LABELS** 13, 22
- Exjade (Novartis Pharmaceuticals UK Ltd) ▼
- Deferasirox 125 mg Exjade 125mg dispersible tablets sugar-free | 28 tablet [POM] £117.60

**Deferiprone**

**DRUG ACTION** Deferiprone, is an oral iron chelator.

**INDICATIONS AND DOSE**
Treatment of iron overload in patients with thalassaemia major in whom deferiprone is contra-indicated or is inadequate
- **BY MOUTH**
  - Child 6–17 years: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

**UNLICENSED USE** Not licensed for use in children under 6 years.

**CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia

**INTERACTIONS** Appendix 1: deferiprone

**SIDE-EFFECTS** Agranulocytosis • arthropathy • blood dyscrasias • gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance) • headache • increased appetite • neutropenia • red-brown urine discoloration • zinc deficiency

**CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in *animal* studies. Contraception advised in females of child-bearing potential.

**PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in *animal* studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.

**RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS** Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.

**PATIENT AND CARER ADVICE**
Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS** 14
- Ferriprox (Swedish Orphan Biovitrum Ltd)
  - Deferiprone 100 mg per 1 ml Ferriprox 100mg/ml oral solution sugar-free | 500 ml [POM] £152.39 DT price = £152.39

---

**Desferrioxamine mesilate**

(Deferoxamine Mesilate)

**INDICATIONS AND DOSE**
Iron poisoning
- **BY CONTINUOUS INTRAVENOUS INFUSION**
- Neonate: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service.

**Aluminium overload in dialysis patients**
- **BY INTRAVENOUS INFUSION**
  - Child: 5 mg/kg once weekly

**Chronic iron overload (low iron overload)**
- **BY SUBCUTANEOUS INFUSION**
  - Child: Initially up to 30 mg/kg 3–7 times a week, to be given over 8–12 hours, the dose should reflect the degree of iron overload

**Chronic iron overload (established overload)**
- **BY SUBCUTANEOUS INFUSION**
  - Child: 20–50 mg/kg daily

**UNLICENSED USE**
- When used for iron poisoning Licensed for use in children (age range not specified by manufacturer).

**CAUTIONS** Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

**INTERACTIONS** Appendix 1: desferrioxamine

**SIDE-EFFECTS**
- Common or very common Abdominal pain • arthralgia • bone disorders • growth retardation • headache • hearing disturbances • injection-site reactions • myalgia • nausea • pyrexia • vomiting
- Rare Anaphylaxis • blood dyscrasias • bone pain • diarrhoea • hepatic impairment • hypotension (especially when given too rapidly by intravenous injection) • leg cramps • lens opacity • leucopenia • rash • retinopathy • thrombocytopenia • visual disturbances • Yersinia and mucormycosis infections
- Very rare Acute respiratory distress • convulsions • dizziness • neurological disturbances • neuropathy • paraesthesia • renal impairment
- Frequency not known Muscle spasms

**PREGNANCY** Teratogenic in *animal* studies. Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

**RENAL IMPAIRMENT** Use with caution.

**MONITORING REQUIREMENTS**
- Eye and ear examinations before treatment and at 3-month intervals during treatment.
- Monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses.
3 Neutropenia and stem cell mobilisation

3.1 Neutropenia

Neutropenia

Management

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim below (unglycosylated rhG-CSF) and lenograstim (glycosylated rhG-CSF) p. 552 have similar effects; both have been used in a variety of clinical settings, including cytotoxic-induced neutropenia, and neutropenia following bone marrow transplantation, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy. Treatment with granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

Neonatal neutropenia

Filgrastim has been used to treat sepsis-induced neutropenia in preterm neonates. There is no clear evidence that granulocyte–colony stimulating factors improve survival or long-term outcomes.

IMMUNOSTIMULANTS ➔ GRANULOCYTE-COLONY STIMULATING FACTORS

Granulocyte-colony stimulating factors

Drug action

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.

DIRECTIONS FOR ADMINISTRATION

For full details and warnings relating to administration, consult product literature.

When used for Chronic iron overload or Aluminium overload in dialysis patients For intravenous or subcutaneous infusion, reconstitute powder with Water for Injection to a concentration of 100 mg/mL; dilute with Glucose 5% or Sodium Chloride 0.9%. In haemodialysis or haemo-filtration administer over the last hour of dialysis (may be given via the dialysis fistula). Intrapерitoneal: may be added to dialysis fluid. In CAPD give prior to the last exchange of the day.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Desferrioxamine mesilate (Non-proprietary)
  - Desferrioxamine mesilate 500 mg Desferioxamine 500mg powder for solution for injection vials | 10 vial | £39.90–£50.00
  - Desferrioxamine mesilate 2 gram Desferioxamine 2g powder for solution for injection vials | 1 vial | £17.95–£20.00
- Desferal (Novartis Pharmaceuticals UK Ltd)
  - Desferrioxamine mesilate 500 mg Desferal 500mg powder for solution for injection vials | 10 vial | £46.63
  - Desferrioxamine mesilate 2 gram Desferal 2g powder for solution for injection vials | 1 vial | £18.66

INDICATIONS AND DOSE

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

- By subcutaneous injection, or by intravenous infusion
  - Child: 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)

- By subcutaneous infusion, or by intravenous infusion
  - Child: 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)

- By subcutaneous infusion, or by subcutaneous injection
  - Child: 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion

SIDE-EFFECTS

- Common or very common Alopecia • anorexia • asthenia • bone pain • chest pain • fever • gastro-intestinal disturbances • headache • injection-site reactions • leucocytosis • musculoskeletal pain • rash • thrombocytopenia
- Rare Acute febrile neutrophilic dermatosis • cutaneous vasculitis • pulmonary side-effects (particularly interstitial pneumonia)

Spleen size should be monitored during treatment—risk of splenomegaly and rupture.
Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Child: 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature

Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Child 16-17 years: 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Child: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Child: Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Persistent neutropenia in HIV infection (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Child: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

Neonatal neutropenia (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 10 micrograms/kg daily, to be discontinued if white cell count exceeds 50 x 10^9/litre.

Glycogen storage disease type 1b (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Child: Initially 5 micrograms/kg daily, dose to be adjusted as necessary

**UNLICENSED USE** Not licensed for treatment of glycogen storage disease or neonatal neutropenia.

**CONTRA-INDICATIONS** Severe congenital neutropenia (Kostmann’s syndrome) with abnormal cytogenetics

**CAUTIONS** Osteoporotic bone disease (monitor bone density if given for more than 6 months) - secondary acute myeloid leukaemia

**SIDE-EFFECTS**

- Common or very common Anaemia · dysuria · epistaxis · exacerbation of rheumatoid arthritis · haematuria · hepatomegaly · mucusitis · osteoporosis · proteinuria · pseudogout · raised uric acid · splenic enlargement · transient decrease in blood glucose · transient hypotension · urinary abnormalities
- Uncommon Capillary leak syndrome (including fatal cases)
- Rare Splenic rupture

**MONITORING REQUIREMENTS** Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).

**DIRECTIONS FOR ADMINISTRATION** For subcutaneous or intravenous infusion, dilute with Glucose 5% to a concentration of not less than 15 micrograms/mL; to dilute to a concentration of 2–15 micrograms/mL, add albumin solution (human albumin solution) to produce a final albumin solution of 2 mg/mL; not compatible with Sodium Chloride solutions.

**PRESCRIBING AND DISPENSING INFORMATION** Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Accofil** (Accord Healthcare Ltd)
  - Filgrastim 60 mega u per 1 ml Accofil 30 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Cost) £284.20
  - Filgrastim 96 mega u per 1 ml Accofil 48 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Cost) £455.70

- **Neupogen** (Amgen Ltd)
  - Filgrastim 30 mega u per 1 ml Neupogen 30 million units/1 ml solution for injection vials | 5 vial (Cost) £263.52
  - **Neupogen Singleject** (Amgen Ltd)
    - Filgrastim 60 mega u per 1 ml Neupogen Singelject 30 million units/0.5 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Cost) £52.70
    - Filgrastim 96 mega u per 1 ml Neupogen Singelject 48 million units/0.5 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Cost) £84.06

- **Nivestim** (Pfizer Ltd)
  - Filgrastim 60 mega u per 1 ml Nivestim 30 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Cost) £246.50 (Hospital only)
    - Nivestim 12 million units/0.2 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Cost) £153.00 (Hospital only)
  - Filgrastim 96 mega u per 1 ml Nivestim 48 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Cost) £395.25 (Hospital only)

- **Zarzio** (Sandoz Ltd)
  - Filgrastim 60 mega u per 1 ml Zarzio 30 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Cost) £250.75
  - Filgrastim 96 mega u per 1 ml Zarzio 48 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Cost) £399.50

**Lenograstim**

(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)

**INDICATIONS AND DOSE**

Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only)

- **BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**
  - Child 2-17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes
Reduction in the duration of neutropenia and associated complications following treatment with cytototoxic chemotherapy associated with a significant incidence of febrile neutropenia (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Child 2-17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy.

Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Child 2-17 years: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors).

Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)

- **BY SUBCUTANEOUS INJECTION**
  - Child 2-17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy, for timing of leucopheresis, consult product literature

### UNLICENSED USE
Not licensed for use in children for cytototoxic-induced neutropenia, mobilisation of peripheral blood progenitor cells (monotherapy or adjunctive therapy), or following peripheral stem cell transplantation.

### SIDE-EFFECTS
Mucositis - splenic rupture - toxic epidermal necrolysis

### DIRECTIONS FOR ADMINISTRATION
For intravenous infusion, dilute reconstituted solution to a concentration of not less than 2 micrograms/mL (Granocyte-13) or 2.5 micrograms/mL (Granocyte-34) with Sodium Chloride 0.9%.

### PRESCRIBING AND DISPENSING INFORMATION
Granocyte® solution for injection contains 105 micrograms of lenograstim per 13.4 mega unit vial and 263 micrograms lenograstim per 33.6 mega unit vial.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Granocyte** (Chugai Pharma UK Ltd)
  - **Lenograstim 13.4 mega u** Granocyte-13 powder and solvent for solution for injection vials 1 vial £40.11 5 vial £200.55
  - **Lenograstim 33.6 mega u** Granocyte-34 powder and solvent for solution for injection vials 1 vial £62.54 5 vial £312.69

## 4 Platelet disorders

### Platelet disorders

#### Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. A corticosteroid, such as prednisolone p. 421, is sometimes used if idiopathic thrombocytopenic purpura does not resolve spontaneously or if it is associated with severe cutaneous symptoms or mucous membrane bleeding; corticosteroid treatment should not be continued longer than 14 days regardless of the response.

**Immunoglobulin** preparations may be used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are often used in preference to a corticosteroid. Anti-D (Rh₄) immunoglobulin p. 741 is licensed for the management of idiopathic thrombocytopenic purpura.

Other therapy that has been tried under specialist supervision in refractory idiopathic thrombocytopenic purpura includes azathioprine p. 495, cyclophosphamide p. 509, vincristine sulfate p. 523, and ciclosporin p. 496. Rituximab p. 505 is also used in specialist centres but experience of its use in children is limited. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 80 may be given to reduce the severity of haemorrhage.

Splenectomy is considered in chronic thrombocytopenic purpura if a satisfactory platelet count is not achieved with regular immunoglobulin infusions, if there is a relapse on withdrawing or reducing the dose of corticosteroid, and if other therapies are considered inappropriate.

### Essential thrombocythaemia

Anagrelide below reduces platelets in essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs.

#### 4.1 Essential thrombocythaemia

**ANTITHROMBOTIC DRUGS**

> CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

**Anagrelide**

- **INDICATIONS AND DOSE**
  - **Essential thrombocythaemia** in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)
    - **BY MOUTH**
      - Child 7-17 years: Initially 500 micrograms daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- **SIDE-EFFECTS**
  - Common or very common: Anaemia - dizziness - fatigue - fluid retention - gastrointestinal disturbances - headache - palpitation - rash - tachycardia
  - Rare: Angina - asthenia - cardiomegaly - cardiomyopathy - colitis - dry skin - dysarthria - gastritis - gingival bleeding - impaired coordination - migraine - myocardial infarction - nocturia - pericardial effusion - postural hypotension - pulmonary hypertension - pulmonary infiltrates - renal
4.2 Idiopathic thrombocytopenic purpura

- Child 6-17 years (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of 50x10^9/litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

- CAUTIONS Patients of East Asian origin - risk factors for thromboembolism
- INTERACTIONS >> Appendix 1: eltrombopag
- SIDE-EFFECTS |
- Frequency not known Increased bone marrow reticulin—discontinue
- CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment.
- PREGNANCY Avoid—toxicity in animal studies.
- BREAST FEEDING Manufacturer advises avoid.
- HEPATIC IMPAIRMENT For idiopathic thrombocytopenic purpura, manufacturer advises avoid unless potential benefit outweighs risk—reduce initial dose to 25 mg once daily and wait at least 3 weeks before upwards titration of dose.
- RENAL IMPAIRMENT Use with caution.
- MONITORING REQUIREMENTS |
  - Manufacturer advises monitor liver function.
  - Monitor serum creatinine.
  - Monitor urea.
  - Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.
  - Monitor closely for further signs of disease progression such as malignant transformation.
- PRESCRIBING AND DISPENSING INFORMATION Initiate only when signs of disease progression or patient suffers from thrombosis. Consider stopping treatment after 3 months if inadequate response.
- PATIENT AND CARER ADVICE |
  - Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. cycling, driving).
medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.

- **PATIENT AND CARER ADVICE** Patient counselling is advised on how to administer eltrombopag tablets.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium has advised (January 2017) that eltrombopag (Revolade®) is accepted for restricted use within NHS Scotland for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged 1 year to 17 years who have severe symptomatic ITP or a high risk of bleeding, and are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This advice is contingent upon the continued availability of the Patient Access Scheme in NHS Scotland, or a list price that is equivalent or lower.

  **All Wales Medicines Strategy Group (AWMSG) Decisions**

  The All Wales Medicines Strategy Group has advised (October 2016) that eltrombopag (Revolade®) is recommended as an option for use within NHS Wales for the treatment of chronic immune (idiopathic) thrombocytopenic purpura (ITP) in patients aged 1 year to 17 years who are refractory to other treatments (e.g. corticosteroids, immunoglobulins). This recommendation applies only if the approved Wales Patient Access Scheme is used or where the list/contract price is equivalent or lower.

- **INDICATIONS AND DOSE**
  - Metabolic acidosis
    - Child: To be administered at an amount appropriate to the body base deficit
  - UNLICENSED USE Unlicensed preparation.
  - CONTRA-INDICATIONS Anuria - chronic respiratory acidosis
  - CAUTIONS Extravasation can cause severe tissue damage

- **SIDE-EFFECTS** Hyperkalaemia in renal impairment - hypoglycaemia - liver necrosis (following administration via umbilical vein) (in neonates) - respiratory depression

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Respiratory depression: Respiratory support may be required because trometamol induces respiratory depression.
  - PREGNANCY Limited information available, hypoglycaemia may harm fetus.
  - BREST FEEDING: No information available.
  - RENAL IMPAIRMENT: Use with caution, may cause hyperkalaemia.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

  **Solution for infusion**

  - Trometamol (Non-proprietary) Trometamol 363.4 mg per 1 ml Tris 36.34% solution for infusion 20ml ampoules | 10 ampoule [P] no price available

#### 2 Fluid and electrolyte imbalances

**Fluids and electrolytes**

**Electrolyte replacement therapy**

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

**Oral preparations for fluid and electrolyte imbalance**

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

**Oral potassium**

Compensation for potassium loss is especially necessary:

- in children in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, renal tubule disorder, the nephrotic syndrome, and severe heart failure;
- in children with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse;
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias.

Measures to compensate for potassium loss may be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are seldom required with the small doses of diuretics given to treat hypertension; potassium-sparing diuretics (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 136 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride p. 575 daily by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency to reduce the risk of hyperkalaemia.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness (small divided doses may minimise gastric irritation); when appropriate, potassium-sparing diuretics are preferable. When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of
any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

**Management of hyperkalaemia**

**Acute severe hyperkalaemia** calls for urgent treatment with intravenous infusion of soluble insulin (0.3–0.6 units/kg/hour in neonates and 0.05–0.2 units/kg/hour in children over 1 month) with glucose 0.5–1 g/kg/hour (5–10 mL/kg of glucose 10%); 2.5–5 mL/kg of glucose 20% via a central venous catheter may also be considered. If insulin cannot be used, salbutamol p. 150 can be given by intravenous injection, but it has a slower onset of action and may be less effective for reducing plasma-potassium concentration.

Calcium gluconate p. 568 is given by slow intravenous injection to manage cardiac excitability caused by hyperkalaemia.

The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 558 should be considered (important: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Intravenous furosemide can also be given but is less effective in children with renal impairment. Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; dialysis may occasionally be required.

**Ion-exchange resins** may be used to remove excess potassium in mild hyperkalaemia or in moderate hyperkalaemia when there are no ECG changes. Calcium polystyrene sulfonate is preferred unless plasma-calcium concentrations are high.

**Oral sodium and water**

Sodium chloride p. 561 is indicated in states of sodium depletion. In preterm neonates in the first few weeks of life and in chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride may be sufficient. Sodium chloride solutions suitable for use by mouth in neonates are available from ‘special-order’ manufacturers or specialist importing companies, they should be used with care because they are hypertonic. Supplementation with sodium chloride may be required to replace losses in children with cystic fibrosis particularly in warm weather.

**Oral rehydration therapy (ORT)**

Diarrhoea in children is usually self-limiting, however, in children under 6 months of age, and more particularly in those under 3 months, symptoms of dehydration may be less obvious and there is a risk of rapid and severe deterioration. Intestinal absorption of sodium and water is enhanced by glucose or another carbohydrate such as rice starch. Oral rehydration solutions used in the UK are lower in sodium than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypermetraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breastfeeding or formula feeds should be offered between oral rehydration drinks.

**Oral bicarbonate**

Sodium bicarbonate is given by mouth for chronic acidotic states such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe metabolic acidosis, sodium bicarbonate can be given intravenously.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Sodium bicarbonate p. 558 may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

Where hyperchloraemic acidosis is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral potassium bicarbonate, although acute or severe deficiency should be managed by intravenous therapy.

**Parenteral preparations for fluid and electrolyte imbalance**

**Electrolytes and water**

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses when it is not possible or desirable to use the oral route. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 561 or glucose 5% p. 564) can also be given subcutaneously by hypodermoclysis.

In an individual patient the nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical examination. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, for example 15% glucose, are best given through an indwelling catheter positioned in a large vein.

**Maintenance fluid requirements** in children are usually derived from the relationship that exists between body-weight and metabolic rate; the figures in the table below may be used as a guide outside the neonatal period. The glucose requirement is that needed to minimise gluconeogenesis from amino acids obtained as substrate from muscle breakdown. Maintenance fluids are intended only to provide hydration for a short period until enteral or parenteral nutrition can be established.

It is usual to meet these requirements by using a standard solution of sodium chloride with glucose p. 563. Solutions containing 20 mmol/litre of potassium chloride p. 575 meet usual potassium requirements when given in the suggested amounts.
Fluid requirements for children over 1 month:

<table>
<thead>
<tr>
<th>Body-weight</th>
<th>24-hour fluid requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Under 10 kg</td>
<td>100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight over 10 kg</td>
</tr>
<tr>
<td>10–20 kg</td>
<td>100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight between 10–20 kg + 20 mL/kg for each 1 kg body-weight over 20 kg (max. 2 litres in females, 2.5 litres in males)</td>
</tr>
<tr>
<td>Over 20 kg</td>
<td>100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight over 20 kg</td>
</tr>
</tbody>
</table>

Important: The baseline fluid requirements shown in the table should be adjusted to take account of factors that reduce water loss (e.g. increased antidiuretic hormone, renal failure, hypothermia, and high ambient humidity) or increase water loss (e.g. pyrexia or burns).

Replacement therapy: Initial intravenous replacement fluid is generally required if the child is over 10% dehydrated, or if 5–10% dehydrated and oral or enteral rehydration is not tolerated or possible. Oral rehydration is adequate, if tolerated, in the majority of those less than 10% dehydrated. Subsequent fluid and electrolyte requirements are determined by clinical assessment of fluid balance.

Intravenous sodium
Intravenous sodium chloride in isotonic (0.9%) solution provides the most important extracellular ions in near physiological concentrations and is indicated in sodium depletion. It may be given for initial treatment of acute fluid loss and to replace ongoing gastrointestinal losses from the upper gastrointestinal tract. Intravenous sodium chloride is commonly given as a component of maintenance and replacement therapy, usually in combination with other electrolytes and glucose.

Chronic hyponatraemia should ideally be corrected by fluid restriction. However, if sodium chloride is required, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome; the rise in plasma sodium concentration should be no more than 10 mmol/litre in 24 hours.

Sodium chloride with glucose solutions are indicated when there is combined water and sodium depletion. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

Compound sodium lactate (Hartmann’s solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded.

Intravenous glucose
Glucose solutions are used mainly to replace water deficit. Water depletion (dehydration) tends to occur when losses are not matched by a comparable intake, as may occur in coma or dysphagia.

Water loss rarely exceeds electrolyte losses but this can occur in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder; the rate of infusion should be adjusted to return the plasma-sodium concentration to normal over 48 hours.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given with insulin for the emergency management of hyperkalaemia. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuous insulin infusion.

Intravenous potassium
Potassium chloride with sodium chloride intravenous infusion p. 561 is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth.

Repeated measurements of plasma-potassium concentration are necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should not involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

Bicarbonate and trometamol
Sodium bicarbonate is used to control severe metabolic acidosis (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastrointestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) p. 558 can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium depletion; in these circumstances sodium bicarbonate is best given intravenously as a small volume of hypertonic solution, such as 8.4%; plasma pH and electrolytes should be monitored. For chronic acidic states, sodium bicarbonate can be given by mouth.

Trometamol (tris(hydroxymethyl)aminomethane, THAM) p. 555, an organic buffer, corrects metabolic acidosis by causing an increase in urinary pH and an osmotic diuresis. It is indicated when sodium bicarbonate is unsuitable as in carbon dioxide retention, hypernatraemia, or renal impairment. It is also used during cardiac bypass surgery and, very rarely, in cardiac arrest.

Plasma and plasma substitutes
Albumin solution p. 569, prepared from whole blood, contains soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient’s blood group.

Albumin is usually used after the acute phase of illness to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in nephrotic syndrome).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma substitutes
Gelatin p. 569 is a macromolecular substance that is metabolised slowly. Gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicaemia; it may also be used...

as an immediate short-term measure to treat haemorrhage until blood is available. Gelatin is rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also the management of shock.

Plasma substitutes should not be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of some plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Neonates lose water through the skin and nose, particularly if preterm or if the skin is damaged. The basic fluid requirement for a term baby in average ambient humidity is 40–60 mL/kg/day plus urinary losses. Preterm babies have very high transepidermal losses particularly in the first few days of life; they may need more fluid replacement than full term babies and up to 180 mL/kg/day may be required. Local guidelines for fluid management in the neonatal period should be consulted.

Intravenous sodium

The sodium requirement for most healthy neonates is 3 mmol/kg daily. Preterm neonates, particularly below 30 weeks gestation, may require up to 6 mmol/kg daily. Hyponatraemia may be caused by excessive renal loss of sodium; it may also be dilutional and restriction of fluid intake may be appropriate. Sodium supplementation is likely to be required if the serum sodium concentration is significantly reduced.

Hypernatraemia may also occur, most often due to dehydration (e.g. breast milk insufficiency). Severe hypernatraemia and hyponatraemia can cause fits and rarely brain damage. Sodium in drug preparations, delivered via continuous infusions, or in infusions to maintain the patency of intravascular or umbilical lines, can result in significant amounts of sodium being delivered, (e.g. 1 mL/hour of 0.9% sodium chloride infused over 24 hours is equivalent to 3.6 mmol/day of sodium).

BICARBONATE

Sodium bicarbonate

- INDICATIONS AND DOSE

Chronic acidic states such as uraemic acidosis or renal tubular acidosis

- BY MOUTH

  - Neonate: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response.
  - Child: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response

Severe metabolic acidosis

- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

  - Child: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous
intravenous infusion of a weaker solution (usually 1.26%)  

Renal hyperkalaemia  
› BY SLOW INTRAVENOUS INJECTION  
› Neonate: 1 mmol/kg daily.  
› Child: 1 mmol/kg daily  

Persistent cyanotic spell in a child with congenital heart disease despite optimal use of 100% oxygen and propranolol  
› BY INTRAVENOUS INFUSION  
› Child: 1 mmol/kg, dose given to correct acidosis (or dose calculated according to arterial blood gas results), sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year

● CONTRA-INDICATIONS  
› With oral use Salt restricted diet  
● CAUTIONS Respiratory acidosis  
● INTERACTIONS  ➔ Appendix 1: sodium bicarbonate  

● SIDE-EFFECTS  
› When used for chronic acidotic states such as uraemic acidosis or renal tubular acidosis Fluid retention (in those at risk) - hypokalaemia may be exacerbated - increase blood pressure - pulmonary oedema (in those at risk)  

● MONITORING REQUIREMENTS  
› With intravenous use Plasma-pH and electrolytes should be monitored.  

● DIRECTIONS FOR ADMINISTRATION  
› With intravenous use For peripheral infusion dilute 8.4% solution at least 1 in 10. For central line infusion dilute 1 in 5 with glucose 5% or 10% or Sodium Chloride 0.9%. Extravasation can cause severe tissue damage.  
› With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.  

● PRESCRIBING AND DISPENSING INFORMATION  
› With oral use Sodium bicarbonate 500mg capsules contain approximately 5 mmol each of Na⁺ and HCO₃⁻; Sodium bicarbonate 600mg capsules contain approximately 7 mmol each of Na⁺ and HCO₃⁻. Oral solutions of sodium bicarbonate are required occasionally; these are available from ‘special-order’ manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.  
› With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na⁺ and HCO₃⁻/litre), various other strengths available.  

● PATIENT AND CARER ADVICE  
Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines. Medicines for Children leaflet: Sodium bicarbonate for acidosis www.medicinesforchildren.org.uk/sodium-bicarbonate-for-acidosis

**INTERACTIONS**
- Appendix 1: potassium chloride

**PRESCRIBING AND DISPENSING INFORMATION**
Each Sando-K® tablet contains potassium 470 mg (12 mmol of K+) and chloride 285 mg (8 mmol of Cl–).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Effervescent tablet**

**CAUTIONARY AND ADVISORY LABELS** 13, 21
- Sando-K® (HK Pharma Ltd)

Potassium bicarbonate 400 mg, Potassium chloride 600 mg Sando-K® effervescent tablets 100 tablet 2 £7.65 DT price = £7.65

---

**Potassium chloride with sodium chloride**

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 575, sodium chloride below.

**INDICATIONS AND DOSE**

**Electrolyte imbalance**
- BY INTRAVENOUS INFUSION
  - Child: Depending on the deficit or the daily maintenance requirements (consult product literature)

**INTERACTIONS**
- Appendix 1: potassium chloride

**PRESCRIBING AND DISPENSING INFORMATION**
Potassium chloride 0.15% with sodium chloride 0.9% contains K+ 20 mmol, Na+ 150 mmol, and Cl– 170 mmol/litre or potassium chloride 0.3% with sodium chloride 0.9% contains K+ 40 mmol, Na+ 150 mmol, and Cl– 190 mmol/litre.

---

**Sodium chloride**

**INDICATIONS AND DOSE**

**Chronic renal salt wasting**
- BY MOUTH
  - Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements

**Sodium supplementation in neonates**
- INITIALLY BY MOUTH

- Neonate up to 36 weeks corrected gestational age: 2 mmol, dose to be administered in 100 ml of formula feed (consult dietician), alternatively (by mouth using modified-release tablets) 3–4 mmol, dose to be administered in 100 ml of breast milk (consult dietician).
**Sodium replacement**  
- **By mouth using modified-release tablets**  
- **Child:** 1–2 mmol/kg daily in divided doses, adjusted according to requirements, higher doses may be needed in severe depletion

**Management of diabetic ketoacidosis (to restore circulating volume if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)**  
- **By intravenous infusion**  
- **Child:** (consult local protocol)

**Diluent for instillation of drugs to the bladder**  
- **By intravesical instillation**  
- **Child:** (consult product literature)

**CAUTIONS**  
- With intravenous use Avoid excessive administration - cardiac failure - cardio-respiratory diseases - children receiving glucocorticoids - dilutional hyponatraemia - hepatic cirrhosis - hypertension - peripheral oedema - pulmonary oedema - reduced fluid loss - renal insufficiency - restrict intake in impaired renal function - toxoaemia of pregnancy

**CAUTIONS, FURTHER INFORMATION**  
- **Reduced fluid loss**  
- **With intravenous use** The volume of fluid infused should take into account the possibility of reduced fluid loss owing to increased antidiuretic hormone and factors such as renal failure, hypothermia, and high humidity.

**Dilutional hyponatraemia**  
- With intravenous use Dilutional hyponatraemia is a rare but potentially fatal risk of parenteral hydration. It may be caused by inappropriate use of hypotonic fluids such as sodium chloride 0.18% and glucose 4% intravenous infusion, especially in the postoperative period when antidiuretic hormone secretion is increased. Dilutional hyponatraemia is characterized by a rapid fall in plasma-sodium concentration leading to cerebral oedema and seizures; any child with severe hyponatraemia or rapidly changing plasma-sodium concentration should be referred urgently to a paediatric high dependency facility.

**SIDE-EFFECTS**  
- With intravenous use Administration of large doses may give rise to sodium accumulation - oedema

**MONITORING REQUIREMENTS**  
- During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

**PRESCRIBING AND DISPENSING INFORMATION**  
- With intravenous use Sodium chloride 0.9% intravenous infusion contains Na⁺ and Cl⁻ each 150 mmol/litre. The term ‘normal saline’ should not be used to describe sodium chloride intravenous infusion 0.9%; the term ‘physiological saline’ is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

- With oral use Each Slow Sodium® tablet contains approximately 10 mmol each of Na⁺ and Cl⁻; tablets can be crushed before administration.

**PATIENT AND CARER ADVICE**

**Sodium chloride with glucose**

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 561, glucose p. 564.

### INDICATIONS AND DOSE

**Combined water and sodium depletion**

**BY INTRAVENOUS INFUSION**

- Child: (consult product literature)

### CAUTIONS

- Sodium chloride 0.18% and glucose 4% intravenous infusion fluid should not be used for fluid replacement in children aged 16 years or less because of the risk of hyponatraemia; availability of this infusion should be restricted to high dependency and intensive care units, and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.

### INTERACTIONS

- Appendix 1: glucose

### MONITORING REQUIREMENTS

- Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.

- During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)**

- **BY INTRAVENOUS INFUSION**
  - Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

**Management of diabetic ketoacidosis**

- **BY INTRAVENOUS INFUSION**
  - Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre

**DOSE EQUIVALENCE AND CONVERSION**

- 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

**CAUTIONS**
Do not give alone except when there is no significant loss of electrolytes - prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances

**INTERACTIONS**
Appendix 1: glucose

**SIDE-EFFECTS**
Glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis

**DIRECTIONS FOR ADMINISTRATION**
With intravenous use Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.

**PRESCRIBING AND DISPENSING INFORMATION**
Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.

**EXCEPTIONS TO LEGAL CATEGORY**
With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

**MEDIcINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for injection, solution for infusion

**Solution for infusion**

- **Glucose (Non-proprietary)**
  - Glucose anhydrous 200 mg per 1 ml Glucose 20% solution for infusion 100ml vials | 1 vial (POM) £5.00

  - Glucose 400 mg per 1 gram Glucogel 40% gel original | 75 gram (GSL) £7.16 DT price + £7.16 | 80 gram (GSL) £6.84
  - **Rapilose (Galen Ltd)**
  - Glucose 400 mg per 1 gram Rapilose 40% gel | 75 gram £5.49 DT price + £7.15

**Infusion**

- **Glucose (Non-proprietary)**
  - Glucose anhydrous 50 mg per 1 ml Glucose 5% infusion 1litre Macoflex bags | 1 bag (£5.00) no price available
  - Glucose 5% infusion 500ml bags | 1 bag (£5.00) £1.91

**INDICATIONS AND DOSE**
Establish presence of gestational diabetes

- **BY MOUTH**
  - Child: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 ml fluid

**Oral glucose tolerance test**

- **BY MOUTH**
  - Child: Test dose 1.75 g/kg (max. per dose 75 g), anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals. To be given with 200–300 ml fluid

**Neonatal hypoglycaemia**

- **BY INTRAVENOUS INFUSION**
  - Neonate: 500 mg/kg/hour, to be administered as Glucose 10% intravenous infusion, an initial dose of 250 mg/kg over 5 minutes may be required if hypoglycaemia is severe enough to cause loss of consciousness or seizures.

**Hypoglycaemia**

- **BY INTRAVENOUS INFUSION**
  - Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

**Energy source**

- **BY INTRAVENOUS INFUSION**
  - Child: (consult product literature)

**Water replacement**

- **BY INTRAVENOUS INFUSION**
  - Child: The volume of glucose solution needed to replace deficits may vary (consult product literature)
**ORAL REHYDRATION SALTS**

**Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride**

(Formulated as oral rehydration salts)

- **INDICATIONS AND DOSE**
  - **Fluid and electrolyte loss in diarrhoea**
    - **By mouth**
    - Child 1-11 months: 1–1½ times usual feed volume to be given
    - Child 1-11 years: 200 mL, to be given after every loose motion
    - Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include black currant, citrus, or natural.

- **PATIENT AND CARER ADVICE**
  - After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder**
    - Dioralyte (Sanofi)
      - Potassium chloride 300 mg, Sodium chloride 470 mg, Disodium hydrogen citrate 530 mg, Glucose 3.56 gram
      - Dioralyte oral powder sachets citrus | 20 sachet [£6.72](https://www.medicinesforchildren.org.uk/oral-rehydration-salts)
      - Dioralyte oral powder sachets plain | 20 sachet [£6.72](https://www.medicinesforchildren.org.uk/oral-rehydration-salts)

**Glucose with potassium chloride, sodium bicarbonate and sodium chloride**

(Formulated as oral rehydration salts)

- **INDICATIONS AND DOSE**
  - **Fluid and electrolyte loss in diarrhoea**
    - **By mouth**
    - Child 1-11 months: 1–1½ times usual feed volume to be given
    - Child 1-11 years: 200 mL, to be given after every loose motion
    - Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 50 mmol, K⁺ 20 mmol, Cl⁻ 40 mmol, HCO₃⁻ 30 mmol, and glucose 111 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include banana, orange, black current, lemon and lime, plain, or multiflavoured.

**Combinations available:**
- Potassium chloride with glucose, p. 560
- Sodium chloride with glucose, p. 560
- Sodium chloride with glucose and sodium chloride, p. 563
2.1 Calcium imbalance

**Calcium**

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand. Hypocalcaemia may be caused by vitamin D deficiency (see Vitamin D under Vitamins p. 596), impaired metabolism, a failure of secretion (hypoparathyroidism), or resistance to parathyroid hormone (pseudohypoparathyroidism).

*Mild asymptomatic hypocalcaemia* may be managed with oral calcium supplements. *Severe symptomatic hypocalcaemia* requires an intravenous infusion of calcium gluconate 10% p. 568 over 5 to 10 minutes, repeating the dose if symptoms persist; in exceptional cases it may be necessary to maintain a continuous calcium infusion over a day or more. Calcium chloride injection p. 567 is also available, but is more irritable; care should be taken to prevent extravasation.

See the role of calcium gluconate in temporarily reducing the toxic effects of *hyperkalaemia*.

Persistent hypocalcaemia requires oral calcium supplements and either a vitamin D analogue (alfalcaldiol p. 603 or calcitriol p. 603) for hypoparathyroidism and pseudohypoparathyroidism or natural vitamin D (calciferol) if due to vitamin D deficiency. It is important to monitor plasma and urinary calcium during long-term maintenance therapy.

**Severe hypercalcaemia**

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 561. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required. The *bisphosphonates* are useful and pamidronate disodium p. 448 is probably the most effective.

*Corticosteroids* are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 450 can be used by specialists for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful. Parathyroidectomy may be indicated for hyperparathyroidism.

**Hypercalciuria**

Hypercalciuria should be investigated for an underlying cause, which should be treated. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

**Neonates**

Hypocalcaemia is common in the first few days of life, particularly following birth asphyxia or respiratory distress. Late onset at 4–10 days after birth may be secondary to vitamin D deficiency, hypoparathyroidism or hypomagnesaemia and may be associated with seizures.

---

**Potassium chloride with rice powder, sodium chloride and sodium citrate (Formulated as oral rehydration salts)**

**INDICATIONS AND DOSE**

**Fluid and electrolyte loss in diarrhoea**

- **BY MOUTH**
  - Child 1-11 months: 1–1½ times usual feed volume to be given
  - Child 1-11 years: 200 mL, to be given after every loose motion
  - Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss

**UNLICENSED USE**

*Dioralyte Relief®* not licensed for use in children under 3 months.

**DIRECTIONS FOR ADMINISTRATION**

Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na+ 60 mmol, K+ 20 mmol, Cl– 50 mmol and citrate 10 mmol.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral powder formulations may include apricot, black currant, or raspberry.

**PATIENT AND CARER ADVICE**

Patients and carers should be advised how to reconstitute *Dioralyte®* oral powder.

After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder**
  - EXCIPIENTS: May contain Aspartame
  - *Dioralyte Relief®* (Sanofi)
    - Potassium chloride 300 mg, Sodium chloride 350 mg, Sodium citrate 580 mg, Rice powder pre-cooked 6 gram
    - Dioralyte Relief oral powder sachets raspberry sugar-free | 6 sachet £1.60
    - Dioralyte Relief oral powder sachets blackcurrant sugar-free | 20 sachet £7.13

**BNFC 2017–2018**
Calcium carbonate

INDICATIONS AND DOSE
Phosphate binding in renal failure and hyperphosphataemia

BY MOUTH

- Child 1–11 months: 120 mg 3–4 times a day, dose to be adjusted as necessary, to be taken with feeds
- Child 1–5 years: 300 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
- Child 6–11 years: 600 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
- Child 12–17 years: 1.25 g 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals

Calcium deficiency

BY MOUTH

- Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
- Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
- Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
- Child 12–17 years: 10 mmol 4 times a day, adjusted according to response

INTERACTIONS

INTERACTIONS 

Appendix 1: calcium salts

PRESCRIBING AND DISPENSING INFORMATION
Adcal® contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol); Calcichew® contains calcium carbonate 2.5 g (calcium 500 mg or Ca²⁺ 12.5 mmol); Calcichew Forte® contains calcium carbonate 2.5 g (calcium 1 g or Ca²⁺ 25 mmol); Cacit® contains calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca²⁺ 12.5 mmol); consult product literature for details of other available products.

Flavours of chewable tablet formulations may include orange or fruit flavour.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Calcium salts for kidney disease: www.medicinesforchildren.org.uk/calcium-salts-kidney-disease-0

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

Calcium carbonate (Non-proprietary) Calcium (as Calcium carbonate) 166.67 mg Chelated Calcium 166.67 mg tablets | 100 tablet no price available

Calcium carbonate 1.25 gram Calcium carbonate 1.25 mg tablets | 100 tablet no price available

Calcium carbonate with calcium lactate gluconate

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium carbonate above.

INDICATIONS AND DOSE

Calcium deficiency

BY MOUTH

- Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
- Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
- Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
- Child 12–17 years: 10 mmol 4 times a day, adjusted according to response

INTERACTIONS

DIRECTIONS FOR ADMINISTRATION

Care should be taken to avoid extravasation

PRESCRIBING AND DISPENSING INFORMATION

Non-proprietary Calcium chloride dihydrate 7.35% (calcium
Fluid and electrolyte imbalances

Calcium gluconate

- **INDICATIONS AND DOSE**
  - **Calcium deficiency** / Mild asymptomatic hypocalcaemia
    - **BY MOUTH**
    - Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
      - Child 1 month-4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
      - Child 5-11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
      - Child 12-17 years: 10 mmol 4 times a day, adjusted according to response
  - **Acute hypocalcaemia, urgent correction** / Hyperkalaemia (prevention of arrhythmias)
    - **BY SLOW INTRAVENOUS INJECTION**
    - Neonate: 0.11 mmol/kg for 1 dose, to be given over 5–10 minutes, some units use a dose of 0.46 mmol/kg (2 mL/kg calcium gluconate 10%) for hypocalcaemia in line with US practice.
    - Child: 0.11 mmol/kg, to be given over 5–10 minutes, maximum 4.5 mmol (20 mL calcium gluconate 10%)

- **Acute hypocalcaemia, maintenance**
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Neonate: 0.5 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation.
    - Child 1 month-1 year: 1 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation; Usual maximum 8.8 mmol
    - Child 2-17 years: 8.8 mmol daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation

- **DOSE EQUIVALENCE AND CONVERSION**
  - 0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

**INTERACTIONS** → Appendix 1: calcium salts

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection, solution for infusion

**Solution for injection**
- Calcium gluconate (Non-proprietary)
- Calcium gluconate 180 mg per 1 mL Calcium gluconate 10% solution for injection 10 mL ampoules | 1 ampoule (POM) £1.92 DT price = £1.42
- Calcium gluconate 120 mg per 1 mL Calcium gluconate 10% solution for injection 5 mL ampoules | 1 ampoule (POM) £0.92
- Calcium gluconate 75 mg per 1 mL Calcium gluconate 10% solution for injection 2 mL pre-filled syringes | 1 pre-filled disposable injection (POM) £0.92
- Calcium gluconate 147 mg per 1 mL Calcium gluconate 14.7% solution for injection 5 mL ampoules | 10 ampoules (POM) £15.98
- Calcium gluconate 140 mg per 1 mL Calcium gluconate 14% solution for injection 5 mL ampoules | 10 ampoules (POM) £15.98
- Calcium gluconate 140 mg per 1 mL Calcium gluconate 14% solution for injection 10 mL ampoules | 10 ampoules (POM) £15.98

**Effervescent tablet**

- CAUTIONARY AND ADVISORY LABELS 13 ELECTROLYTES: May contain Sodium

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection, solution for infusion

**Solution for injection**
- Calcium lactate (Non-proprietary)
- Calcium lactate 300 mg Calcium lactate 300 mg tablets | 84 tablet no price available DT price = £4.57 | 84 tablet (GSL) £4.57 DT price = £4.57

**Calcium phosphate**

- **INDICATIONS AND DOSE**
  - Indications listed in combination monographs (available in the UK only in combination with other drugs)
    - **BY MOUTH**
    - Child: Doses listed in combination monographs

- **INTERACTIONS** → Appendix 1: calcium salts

**IMPORTANT SAFETY INFORMATION**

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.
2.2 Low blood volume

BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

Albumin solution (Human Albumin Solution)

- INDICATIONS AND DOSE
  Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)
  ▶ BY INTRAVENOUS INFUSION
  ▶ Child: (consult product literature)
  Adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn (with concentrated solutions 20%)
  ▶ BY INTRAVENOUS INFUSION
  ▶ Child: (consult product literature)

- CONTRA-INDICATIONS
  Cardiac failure • severe anaemia

- CAUTIONS
  Correct dehydration when administering concentrated solution • history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) • history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) • increased capillary permeability

- SIDE-EFFECTS
  Anaphylaxis • chills • fever • hypersensitivity reactions • hypotension • increased salivation • nausea • tachycardia • vomiting

- MONITORING REQUIREMENTS
  Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

- PRESCRIBING AND DISPENSING INFORMATION
  A solution containing protein derived from plasma, serum, or normal plasma; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Infusion
  ▶ Flexbumin (Baxalta UK Ltd)
    Albumin solution human 200 gram per 1 litre Flexbumin 20% infusion 100ml bags | 1 bag (Pam) no price available | 12 bag (Pam) no price available
    Flexbumin 20% infusion 50ml bags | 1 bag (Pam) no price available | 24 bag (Pam) no price available
  Solution for infusion
  ▶ Albunorm (Octapharma Ltd)
    Albunorm solution human 50 mg per 1 ml Albunorm 5% solution for infusion 250ml bottles | 1 bottle (Pam) £25.50
    Albunorm 5% solution for infusion 100ml bottles | 1 bottle (Pam) £10.20

Gelatin

- INDICATIONS AND DOSE
  Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass
  ▶ BY INTRAVENOUS INFUSION
  ▶ Child: Initially 10–20 mL/kg, use 3.5–4% solution

- CAUTIONS
  Cardiac disease • severe liver disease

- FURTHER INFORMATION
  The use of plasma substitutes in children requires specialist supervision due to the risk of fluid overload; use is best restricted to an intensive care setting.

- SIDE-EFFECTS
  ▶ Rare • Severe anaphylactic reactions
  ▶ Frequency not known • Hypersensitivity reactions • transient increase in bleeding time

- PREGNANCY
  Manufacturer of Geloplasma® advises avoid at the end of pregnancy.

- HEPATIC IMPAIRMENT
  Use with caution in severe impairment.

- REINAL IMPAIRMENT
  Use with caution in renal impairment.

- MONITORING REQUIREMENTS
  ▶ Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
  ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

- PRESCRIBING AND DISPENSING INFORMATION
  The gelatin is partially degraded. Gelaspan® contains succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na+ 151 mmol, K+ 4 mmol, Mg2+ 1 mmol, Cl– 103 mmol, Ca2+ 1 mmol, acetate 24 mmol/litre; Gelofusine® contains...
sucinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 124 mmol/litre; Gelolasina® contains partially hydrolysed and sucinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na⁺ 150 mmol, K⁺ 5 mmol, Mg²⁺ 1.5mmol, Cl⁻ 100 mmol, lactate 30 mmol/litre; Isoplex® contains sucinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40g (4%), Na⁺ 145 mmol, K⁺ 4 mmol, Mg²⁺ 0.9 mmol, Cl⁻ 105 mmol, lactate 25mmol/litre; Volplex® contains sucinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 125 mmol/litre.

### 2.3 Magnesium imbalance

#### Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypomagnesaemia (causing muscle weakness and arrhythmias) is rare.

#### Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypomagnesaemia; deficiency may also occur as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia (with which it may be confused), particularly in neonates, and also hypokalaemia and hyponatraemia.

Symptomatic hypomagnesaemia is associated with a deficit of 0.5–1 mmol/kg. Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth in divided doses, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution below is available as a licensed preparation.

#### Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as torsade de pointes.

### 2.3a Hypomagnesaemia

#### ELECTROLYTES AND MINERALS > MAGNESIUM

#### Magnesium aspartate

- **INDICATIONS AND DOSE**  
  Treatment and prevention of magnesium deficiency
  - **By mouth**
    - Child 2–3 years: 4.5 mmol daily, given as one level 5 mL spoonful of Magnaspartate® powder.
    - Child 4–9 years: 4.5 mmol daily, given as a 5 mL level spoonful of Magnaspartate® powder, alternatively 10 mmol daily, given as 1 sachet of Magnaspartate® powder.
    - Child 10–17 years: 10 mmol daily, given as 1 sachet of Magnaspartate® powder.

- **SIDE-EFFECTS**
  - **Common** Diarrhoea
  - **Rare** Hypomagnesaemia
  - **Frequency not known** Dental caries (on long term use) • gastrointestinal irritation

- **SIDE-EFFECTS, FURTHER INFORMATION**
  Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

- **OVERDOSE**
  Symptoms of hypomagnesaemia may include nausea, vomiting, flushing of the skin, thirst, hypotension due to peripheral vasodilatation, drowsiness, confusion, loss of tendon reflexes and respiratory depression due to neuromuscular blockade, slurred speech, double vision, muscle weakness, bradycardia, cardiac arrhythmias, coma, and cardiac arrest.

- **RENAAL IMPAIRMENT**
  Avoid in severe impairment (estimated glomerular filtration rate less than 30 mL/minute/1.73²).

- **DIRECTIONS FOR ADMINISTRATION**
  Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Magnaspartate® contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.

- **PATIENT AND CARER ADVICE**
  Patients and carers should be given advice on how to administer magnesium aspartate powder.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder

- **EXCIPIENTS:** May contain Sucrose
  - Magnaspartate (KoRa Healthcare)
    - Magnesium (as Magnesium aspartate) 243 mg Magnaspartate 243 mg (magnesium 10 mmol) oral powder sachets | 10 sachets (Pom) £2.25
Magnesium glycerophosphate

**INDICATIONS AND DOSE**

**Hypomagnesaemia**
- **MOUTH**
  - Child 1 month–11 years: Initially 0.2 mmol/kg 3 times a day, dose to be adjusted as necessary, dose expressed as Mg\(^{2+}\)
  - Child 12–17 years: Initially 4–8 mmol 3 times a day, dose to be adjusted as necessary, dose expressed as Mg\(^{2+}\)

**DOSE EQUIVALENCE AND CONVERSION**
- Magnesium glycerophosphate 1 g is approximately equivalent to Mg\(^{2+}\) 4 mmol or magnesium 97 mg.

**UNLICENSED USE** Not licensed for use.

**INTERACTIONS** → Appendix 1: magnesium

**SIDE-EFFECTS** Arrhythmias · colic · coma · confusion · diarrhoea · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting

**RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.

**MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

**DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water.

**MEDICINAL FORMS**

**DIRECTIONS FOR ADMINISTRATION BY INTRAVENOUS INJECTION**

- **INFUSION**
  - Child 1 month–11 years: 50 mg/kg every 12 hours as required, to be given over at least 10 minutes.
  - Child 12–17 years: 1 g every 12 hours as required, to be given over at least 10 minutes

**Hypomagnesaemia maintenance (e.g. in intravenous nutrition)**
- **BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION**
- **Child**: 50–100 mg/kg daily; maximum 5 g per day

**Neonatal hypocalaemia**
- **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
- Neonate: 100 mg/kg every 6–12 hours as required, to be given over at least 10 minutes.

**Torsade de pointes**
- **BY INTRAVENOUS INJECTION**
  - Child: 25–50 mg/kg (max. per dose 2 g), to be given over 10–15 minutes, dose may be repeated once if necessary (consult local protocol)

**DOSE EQUIVALENCE AND CONVERSION**
- Magnesium sulfate heptahydrate 1 g equivalent to Mg\(^{2+}\) approx. 4 mmol.

**UNLICENSED USE** Unlicensed indication in severe acute asthma. Continuing respiratory deterioration in anaphylaxis.

**INTERACTIONS** → Appendix 1: magnesium

**SIDE-EFFECTS** Arrhythmias · coma · confusion · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting

**PREGNANCY** Sufficient amount may cross the placenta in mothers treated with high doses e.g. in pre-eclampsia, causing hypotonia and respiratory depression in newborns.

**HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.

**RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.

**MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use: In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump).
With intravenous use For intravenous infusion, in persistent pulmonary hypertension of the newborn, dilute to a max. concentration of 100 mg/mL (10%) (0.4 mmol/mL Mg²⁺) magnesium sulfate heptahydrate (200 mg/mL (0.8 mmol/mL Mg²⁺) if fluid restricted) with Glucose 5% or Sodium Chloride 0.9%.

With intravenous use For neonatal hypocalcaemia, hypomagnesaemia, and torsade de pointes, dilute to 10% (100 mg magnesium sulfate heptahydrate (0.4 mmol Mg²⁺) in 1 mL) with Glucose 5% or 10%, Sodium Chloride 0.45% or 0.9% or Glucose and Sodium Chloride combinations. Up to 20% solution may be given in fluid restriction. Rate of administration should not exceed 10 mg/kg/minute (0.04 mmol/kg/minute Mg²⁺) of magnesium sulfate heptahydrate.

PRESCRIBING AND DISPENSING INFORMATION
The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg²⁺) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, or solution for infusion

Solution for injection
- Magnesium sulfate (Non-proprietary) Magnesium sulfate heptahydrate 500 mg per 1 mL Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 10ml ampoules | 10 ampoule PT £11.85–£35.25 Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 20ml vials | 10 vial PT £46.40 Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 5ml ampoules | 10 ampoule PT £2.18–£61.26 Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 2ml ampoules | 10 ampoule PT £11.72–£17.90 DT price = £11.85

Solution for infusion - Magnesium sulfate (Non-proprietary) Magnesium sulfate heptahydrate 100 mg per 1 mL Magnesium sulfate 10% (magnesium 0.4mmol/ml) solution for infusion 10ml ampoules | 10 ampoule PT £59.98–£60.50 Magnesium sulfate heptahydrate 500 mg per 1 mL Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial PT £63.70

2.4 Phosphate imbalance

Phosphorus

Phosphate supplements
Oral phosphate supplements p. 573 may be required in addition to vitamin D in children with hypophosphataemic vitamin D-resistant rickets, see also Vitamin D, under Vitamins p. 596.

Parenteral feeding should not be used because accumulation may lead to increased plasma-aluminium concentrations. Sevelamer hydrochloride is licensed for the treatment of hyperphosphataemia in adults on haemodialysis or peritoneal dialysis. Although experience is limited in children sevelamer hydrochloride may be useful when hypercalcaemia prevents the use of calcium carbonate p. 567.

2.4a Hyperphosphataemia

Electrolytes and Minerals > Aluminium

Aluminium hydroxide

INDICATIONS AND DOSE
Hyperphosphataemia in renal failure
- BY MOUTH USING CAPSULES
  - Child 5-11 years: 1–2 capsules 3–4 times a day, dose adjusted as necessary
  - Child 12-17 years: 1–5 capsules 3–4 times a day, dose adjusted as necessary

CONTRA-INDICATIONS, FURTHER INFORMATION
- Neonates and infants Aluminium-containing antacids should not be used because accumulation may lead to increased plasma-aluminium concentrations.
- INTERACTIONS Appendix: 1: antacids
- SIDE-EFFECTS Constipation, hyperaluminaemia
- HEPATIC IMPAIRMENT Avoid; can cause constipation which can precipitate coma.
- RENAL IMPAIRMENT There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule
- Alu-Cap (Meda Pharmaceuticals Ltd) Aluminium hydroxide 475 mg Alu-Cap 475mg capsules | 120 capsule PT £13.71 DT price = £13.71

The child should be well hydrated and electrolytes monitored.

Neonates
Phosphate deficiency may occur in very low-birthweight infants and may compromise bone growth if not corrected. Parenterally fed infants may be at risk of phosphate deficiency due to the limited solubility of phosphate. Some units routinely supplement expressed breast milk with phosphate, although the effect on the osmolarity of the milk should be considered.

Phosphate-binding agents
Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride is licensed for the treatment of hyperphosphataemia in adults on haemodialysis or peritoneal dialysis. Although experience is limited in children sevelamer hydrochloride may be useful when hypercalcaemia prevents the use of calcium carbonate p. 567.
ELECTROLYTES AND MINERALS > CALCIUM

Calcium acetate

- INDICATIONS AND DOSE

PHOSEX® TABLETS
Phosphate binding in renal failure and hyperphosphataemia
  - BY MOUTH
  - Child: Dose to be adjusted according to requirements of patient, dose to be taken with meals (consult product literature)

- INTERACTIONS → Appendix 1: calcium salts

- DIRECTIONS FOR ADMINISTRATION

PHOSEX® TABLETS Phosex® tablets are taken with meals. Tablets can be broken to aid swallowing, but not chewed (bitter taste).

- PRESCRIBING AND DISPENSING INFORMATION

PHOSEX® tablets contain calcium acetate 1 g (equivalent to calcium 250 mg or Ca\(^{++}\) 6.2 mmol).

- PATIENT AND CARER ADVICE

Medicines for Children leaflet: Calcium salts for kidney disease www.medicinesforchildren.org.uk/calcium-salts-kidney-disease-0

PHOSEX® TABLETS Patients or carers should be given advice on how to administer Phosex® tablets.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

PHOSPHATE BINDERS

Sevelamer

31-Oct-2016

- INDICATIONS AND DOSE

RENAGEL®

Hyperphosphataemia in patients on haemodialysis or peritoneal dialysis
  - BY MOUTH
  - Child 12–17 years: Initially 0.8–1.6 g 3 times a day, dose to be given with meals and adjusted according to serum-phosphate concentration

- UNLICENSED USE

Not licensed for use in children under 18 years.

- CONTRA-INDICATIONS

Bowel obstruction

- CAUTIONS

Gastro-intestinal disorders

- SIDE-EFFECTS

  - Common or very common Abdominal pain · constipation · diarrhoea · dyspepsia · flatulence · nausea · vomiting
  - Frequency not known Diverticulitis · ileus · intestinal obstruction (higher incidence with sevelamer hydrochloride salt) · intestinal perforation · pruritus · rash

- PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk.

- BREAST FEEDING

Manufacturer advises use only if potential benefit outweighs risk.

- PATIENT AND CARER ADVICE

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2.4b Hypophosphataemia

ELECTROLYTES AND MINERALS > PHOSPHATES

Phosphate

- INDICATIONS AND DOSE

Hyphosphataemia | Hypophosphataemic rickets | Osteomalacia
  - BY MOUTH USING EFFERVESCENT TABLETS

- Neonate: 1 mmol/kg daily in 1–2 divided doses, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 ml if calcium also added, contact pharmacy department for details.

- Child 1 month–4 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 ml if calcium also added, contact pharmacy department for details; maximum 48 mmol per day

- Child 5–17 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary; maximum 97 mmol per day

- BY INTRAVENOUS INFUSION

Neonate: 1 mmol/kg daily, dose to be adjusted as necessary.

- Child 1 month–1 year: 0.7 mmol/kg daily, dose to be adjusted as necessary

- Child 2–17 years: 0.4 mmol/kg daily, dose to be adjusted as necessary

- GENERAL CAUTIONS

Cardiac disease · dehydration · diabetes mellitus · sodium and potassium concentrations of preparations

- SPECIFIC CAUTIONS

- With intravenous use Avoid extravasation · severe tissue necrosis

- SIDE-EFFECTS

- Common or very common Diarrhoea

- Frequency not known Acute renal failure · hypocalcaemia · hypotension · metastatic calcification · nausea · oedema · phlebitis · tissue necrosis on extravasation

- SIDE-EFFECTS, FURTHER INFORMATION

Diarrhoea is a common side-effect and should prompt a reduction in dosage.

- IMPORTANT SAFETY INFORMATION

Some phosphate injection preparations also contain potassium. For peripheral intravenous administration the concentration of potassium should not usually exceed 40 mmol/litre. The infusion solution should be thoroughly mixed. Local policies on avoiding inadvertent use of potassium concentrate should be followed. The potassium content of some phosphate preparations may also limit the rate at which they may be administered.
**2.5 Potassium imbalance**

### 2.5a Hyperkalaemia

Other drugs used for Hyperkalaemia: Calcium gluconate, p. 568; insulin, p. 436; Salbutamol, p. 150

---

**ANTIDOTES AND CHELATORS**

<table>
<thead>
<tr>
<th>Calcium polystyrene sulfonate</th>
</tr>
</thead>
</table>

**INDICATIONS AND DOSE**

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

- **By mouth**
  - Child: 0.5–1 g/kg daily in divided doses; maximum 60 g per day

- **By rectum**
  - Neonate: 0.5–1 g/kg daily; irrigate colon to remove resin after 8–12 hours.

  - Child: 0.5–1 g/kg daily; irrigate colon to remove resin after 8–12 hours; maximum 30 g per day

**SORBISTERIT® POWDER**

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

- **By mouth**
  - Child: 0.5–1 g/kg daily, to be given in at least 3 divided doses; maximum 60 g per day

- **By rectum**
  - Neonate: 0.5–1 g/kg daily, retained for 6 hours followed by irrigation to remove resin from colon.

  - Child: 0.5–1 g/kg daily, retained for 6 hours followed by irrigation to remove resin from colon; maximum 40 g per day

**CONTRA-INDICATIONS**

- Hyperparathyroidism
- Metastatic carcinoma
- Multiple myeloma
- Obstructive bowel disease
- Reduced gut motility (in neonates)
- Sarcoidosis

**CAUTIONS**

- Impaction of resin with excessive dosage or inadequate dilution

**INTERACTIONS**

- Appendix 1: polystyrene sulfonate

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Anorexia
- Constipation (discontinue treatment—avoid magnesium-containing laxatives)
- Diarrhoea
- Gastric irritation
- Gastro-intestinal obstruction
- Hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment)
- Hypomagnesaemia
- Intestinal necrosis (reported with concomitant sorbitol)
- Ischaemic colitis
- Nausea
- Nephrosis
- Ulceration
- Vomiting

**SPECIFIC SIDE-EFFECTS**

- With oral use: Gastric-intestinal concretions
- With rectal use: Faecal impaction

**PREGNANCY**

- Manufacturers advise use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING**

- Manufacturers advise use only if potential benefit outweighs risk—no information available.

**MONITORING REQUIREMENTS**

- Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

**DIRECTIONS FOR ADMINISTRATION**

- With rectal use: Mix each 1 g of resin with 5 mL of water or 10% glucose.

**SORBISTERIT® POWDER**

- By mouth, administer in a small amount of water or soft drink—do not give with fruit juice or squash, which have a high potassium content.

  - By rectum, mix each 1 g of resin with 4 mL of 5% glucose.
Sodium polystyrene sulfonate

- **INDICATIONS AND DOSE**
  - Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients
    - **BY MOUTH**
      - Child: 0.5–1 g/kg daily in divided doses; maximum 60 g per day
    - **BY RECTUM**
      - Neonate: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours.
      - Child: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours; maximum 30 g per day
  - **CONTRA-INDICATIONS** Obstructive bowel disease - reduced gut motility (in neonates)
  - **CAUTIONS** Congestive heart failure, hypertension, impaction of resin with excessive dosage or inadequate dilution - oedema
  - **INTERACTIONS** → Appendix 1: polystyrene sulfonate
  - **SIDE-EFFECTS**
    - **GENERAL SIDE-EFFECTS**
      - Anorexia, constipation (discontinue treatment - avoid magnesium-containing laxatives) - diarrhoea, gastric irritation - gastro-intestinal obstruction - hypocalcaemia - hypomagnesaemia - intestinal necrosis (reported with concomitant use of sorbitol) - ischaemic colitis - nausea - necrosis - sodium retention - ulceration - vomiting
  - **SPECIFIC SIDE-EFFECTS**
    - With oral use: Gastro-intestinal concretions
    - With rectal use: Faecal impaction
  - **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk - no information available.
  - **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk - no information available.
  - **RENAL IMPAIRMENT** Use with caution.
  - **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
  - **DIRECTIONS FOR ADMINISTRATION**
    - **BY RECTUM**
      - Mix each 1 g of resin with 5 mL of water or 10% glucose.
      - With oral use: Administer dose (powder) in a small amount of water or honey - do not give with fruit juice or squash, which have a high potassium content.
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - **Powder**
    - CAUTIONARY AND ADVISORY LABELS 13, 21 (Sorbisterit® powder only)
    - **Excipients:** May contain Sucrose
  - **Calcium Resonium** (Sanofi)
    - Calcium polystyrene sulfonate 999.34 mg per 1 gram
    - Calcium Resonium powder sugar-free | 300 gram [P] £82.16

---

**Potassium bicarbonate with potassium acid tartrate**

**INICATIONS AND DOSE**
- Hyperchloroacetic acidosis associated with potassium deficiency (as in some renal tubular and gastro-intestinal disorders)
  - **BY MOUTH**
    - Child: (consult product literature)

**CONTRA-INDICATIONS** Hypochloroacetic acidosis

**CAUTIONS**
- Cardiac disease

**SIDE-EFFECTS**
- Abdominal pain, diarrhoea, flatulence, nausea, vomiting

**RENA IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

**DIRECTIONS FOR ADMINISTRATION**
- To be dissolved in water before administration.

**PRESCRIBING AND DISPENSING INFORMATION**
- These tablets do not contain chloride.

---

**Potassium chloride**

**INDICATIONS AND DOSE**
- Prevention of hypokalaemia (patients with normal diet)
  - **BY MOUTH**
    - Child: 1–2 mmol/kg daily; Usual maximum 50 mmol
- **Electrolyte imbalance**
  - **BY INTRAVENOUS INFUSION**
    - Neonate: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements.
    - Child: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements

**Potassium depletion**
- **BY MOUTH**
  - Neonate: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration.
  - Child: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration

**IMPWRTANT SAFETY INFORMATION**
- **SAFE PRACTICE**
  - Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be thoroughly mixed. Local policies on avoiding
3 Metabolic disorders

Use of medicines in metabolic disorders

Metabolic disorders should be managed under the guidance of a specialist. As many preparations are unlicensed and may be difficult to obtain, arrangements for continued prescribing and supply should be made in primary care.

General advice on the use of medicines in metabolic disorders can be obtained from:

Alder Hey Children’s Hospital, Medicines Information Centre
(0151) 252 5381

and

Great Ormond Street Hospital for Children, pharmacy
(020) 7405 9200

Urea cycle disorders

Sodium benzoate p. 587 and sodium phenylbutyrate p. 588 are used in the management of urea cycle disorders. Both, either singly or in combination, are indicated as adjunctive therapy in all patients with neonatal–onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy. Sodium benzoate is also used in non-ketotic hyperglycinaemia.

The long-term management of urea cycle disorders includes oral maintenance treatment with sodium benzoate and sodium phenylbutyrate combined with a low protein diet and other drugs such as arginine p. 586 or citrulline p. 587, depending on the specific disorder.

Emergency management

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at: www.bimdg.org.uk.
3.1 Acute porphyrias

Acute porphyrias

Overview

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10,000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyrinogenic crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs. Acute attacks of porphyria are exceptionally rare before puberty. When acute porphyria is suspected in a child, support from an expert porphyria service should be sought.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate p. 578 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke’s Hospital, and King’s College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered safe in acute porphyrias is available at www.wmic.wales.nhs.uk/specialist-services/drugs-in-porphyria/. Further information may be obtained from: www.porphyria-europe.org and also from:

Welsh Medicines Information Centre
University Hospital of Wales
CF14 4XW
Cardiff
(029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Alkylating drugs (contact Welsh Medicines Information Centre for further advice)
- Anabolic steroids
- Antidepressants (includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazadone thought to be safe)
- Antihistamines (alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe)
- Barbiturates (includes primidone and thiopental)
- Calcium channel blockers (amlodipine, felodipine, and nifedipine thought to be safe)
- Contraceptives, hormonal (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in young women who have had a previous attack. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Ergot derivatives (includes ergometrine (oxytocin probably safe) and pergolide)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact Welsh Medicines Information Centre for further advice)
- Progestogens (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in young women who have had a previous attack. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Protease inhibitors (contact Welsh Medicines Information Centre for further advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonylureas (glipizide is thought to be safe)
- Taxanes (contact Welsh Medicines Information Centre for further advice)
- Thiazolidinediones (contact Welsh Medicines Information Centre for further advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant (contact Welsh Medicines Information Centre for further advice)
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Bromocriptine
- Buspirone
- Cabergoline
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clindamycin
- Cocaine
- Colistimethate sodium
- Danazol
- Dapsone
- Dexfenfluramine
- Disopyramide
- Disulfiram
- Erythromycin
Blood and nutrition

3.2 Carnitine deficiency

AMINO ACIDS AND DERIVATIVES

Levocarnitine
(Human hemin)

INDICATIONS AND DOSE

Primary carnitine deficiency due to inborn errors of metabolism

BY MOUTH

> Neonate: Up to 200 mg/kg daily in 2–4 divided doses.
> Child: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day.

INITIALLY BY INTRAVENOUS INFUSION

> Neonate: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

> Child: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

BY SLOW INTRAVENOUS INJECTION

> Neonate: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

> Child: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.
Secondary carnitine deficiency in haemodialysis patients

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
- **Child:** 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course.

Organic acidaemias

- **BY MOUTH**
  - **Neonate:** Up to 200 mg/kg daily in 2–4 divided doses.
  - **Child:** Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day.
  - **INITIALLY BY INTRAVENOUS INFUSION**
  - **Neonate:** Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.
  - **Child:** Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.
  - **BY SLOW INTRAVENOUS INJECTION**
  - **Neonate:** Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.
  - **Child:** Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

**□ UNLICENSED USE** Not licensed for use in organic acidaemias. Not licensed for use by intravenous infusion. Tablets, chewable tablets, and oral liquid (10%) not licensed in children under 12 years. Paediatric oral solution (30%) not licensed in children over 12 years.

- **CAUTIONS** Diabetes mellitus
- **SIDE-EFFECTS** Abdominal pain • body odour • diarrhoea • nausea • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

- **PREGNANCY** Appropriate to use; no evidence of teratogenicity in animal studies.
- **RENAI IMPAIRMENT** Accumulation of metabolites may occur with chronic oral administration in severe impairment.
- **MONITORING REQUIREMENTS**
  - Monitoring of free and acyl carnitine in blood and urine recommended.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous infusion, dilute injection with Sodium Chloride 0.9% or Glucose 5% or 10%.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - When used for Organic acidaemias L-carnocitine is used in the treatment of some organic acidaemias; however, use in fatty acid oxidation is controversial.
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Carnitine for metabolic disorders www.medicinesforchildren.org.uk/carnitine-metabolic-disorders-0

**□ MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

**Solution for injection**
- **Carnitor** (Logixx Pharma Solutions Ltd)
  - L-Carnitine 200 mg per 1 ml Carnitor 1g/5ml solution for injection ampoules | 5 ampoule [PO] £59.50

**Oral solution**
- **Levcarnitine (Non-proprietary)**
  - L-Carnitine 300 mg per 1 ml Levcarnitine 1.5g/5ml (30%) oral solution paediatric | 20 ml [PO] £71.40 DT price = £71.40
  - **Carnitor** (Logixx Pharma Solutions Ltd)
  - L-Carnitine 100 mg per 1 ml Carnitor oral single dose 1g solution sugar-free | 10 unit dose [PO] £35.00

**Chewable tablet**
- **Carnitor** (Logixx Pharma Solutions Ltd)
  - L-Carnitine 1 gram Carnitor 1g chewing tablets | 10 tablet [PO] £35.00

**Capsule**
- **Levcarnitine (Non-proprietary)**
  - L-Carnitine 250 mg Carnitine 250mg capsules | 125 capsule £11.06
  - L-Carnitine 500 mg L-Carnitine 500mg capsules | 60 capsule £11.14

### 3.3 Fabry’s disease

**ENZYMES**

**Agalsidase alfa**

- **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

- **INDICATIONS AND DOSE**
  - **Fabry’s disease (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
    - **Child** 7-17 years: 200 micrograms/kg every 2 weeks

- **INTERACTIONS** → Appendix 1: agalsidase
- **SIDE-EFFECTS**
  - **Common or very common** Acne • angioedema • arthralgia • asthenia • bradycardia • chest pain • cough • dizziness • dyspnoea • eye irritation • fatigue • flushing • gastrointestinal disturbances • headache • hypersensitivity reactions • hypertension • hypotension • influenza •-like symptoms • muscle spasms • myalgia • nasopharyngitis • neuropathic pain • oedema • palpitation • paraesthesia • pruritus • rash • rhinorrhrea • sleep disturbances • syncope • tachycardia • taste disturbances • tinnitus • tremor • urticaria
  - **Uncommon** Cold extremities • ear pain • ear swelling • injection-site reactions • parosmia • skin discoloration
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.
  - **PREGNANCY** Use with caution.
  - **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Administration for intravenous infusion, dilute requisite dose with 100 mL Sodium Chloride 0.9% and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for infusion**
    - **Replagal** (Shire Pharmaceuticals Ltd)
      - Agalsidase alfa 1 mg per 1 ml Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial [PO] £1,068.64
Agalsidase beta

- **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

- **INDICATIONS AND DOSE**
  - Fabry’s disease (specialist use only)
    - **BY INTRAVENOUS INFUSION**
      - Child 8-17 years: 1 mg/kg every 2 weeks

- **INTERACTIONS** Appendix 1: agalsidase

- **SIDE-EFFECTS**
  - **Common or very common** Acne, angioedema, arthralgia, asthenia, bradycardia, chest pain, cough, dizziness, dyspnoea, eye irritation, fatigue, flushing, gastrointestinal disturbances, headache, hypersensitivity reactions, hypertension, hypotension, influenza-like symptoms, muscle spasms, myalgia, nasopharyngitis, neuropathic pain, oedema, palpitation, paraesthesia, pruritus, rash, rhinorrhea, sleep disturbances, syncope, tachycardia, taste disturbances, tinnitus, tremor, urticaria
  - **Uncommon** Cold extremities, ear pain, ear swelling, injection-site reactions, parosmia, skin discoloration

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Infusion-related reactions: Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion, given intermittently in Sodium chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for infusion**
    - **Fabryzyme (Genzyme Therapeutics Ltd)**
      - Agalsidase beta 5 mg Fabryzyme 5mg powder for solution for infusion vials | 1 vial (£54) £315.08
      - Agalsidase beta 35 mg Fabryzyme 35mg powder for solution for infusion vials | 1 vial (£54) £2.196.59

3.4 Gaucher’s disease

**ENZYMES**

- **Imiglucerase**
  - **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher’s disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

  - **INDICATIONS AND DOSE**
    - **Gaucher’s disease type I (specialist use only)**
      - **BY INTRAVENOUS INFUSION**
        - Neonate: Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate.
        - Child: Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate.
    - **Gaucher’s disease type III (specialist use only)**
      - **BY INTRAVENOUS INFUSION**
        - Neonate: Initially 60–120 units/kg every 2 weeks, adjusted according to response.
        - Child: Initially 60–120 units/kg every 2 weeks, adjusted according to response.

  - **SIDE-EFFECTS**
    - **Common or very common** Angioedema, backache, cyanosis, flushing, hypersensitivity reactions, hypotension, paraesthesia, tachycardia, urticaria
    - **Uncommon** Abdominal cramps, arthralgia, diarrhoea, dizziness, fatigue, fever, headache, injection-site reactions, nausea, vomiting

  - **PREGNANCY** Manufacturer advises use with caution—limited information available.

  - **BREAST FEEDING** No information available.

- **MONITORING REQUIREMENTS**
  - Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.
  - When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cerezyme®), give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Powder for solution for infusion**
      - **Cerezyme (Genzyme Therapeutics Ltd)**
        - Imiglucerase 400 unit Cerezyme 400 unit powder for solution for infusion vials | 1 vial (£54) £1,071.29
**Velaglucerase alfa**

**DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type 1 Gaucher’s disease.

**INDICATIONS AND DOSE**

**Type I Gaucher’s disease (specialist use only)**
- **BY INTRAVENOUS INFUSION**
  - Child 4–17 years: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

**SIDE-EFFECTS** Abdominal pain, arthralgia, back pain, bone pain, dizziness, flushing, headache, hypersensitivity reactions, hypertension, hypotension, malaise, nausea, pyrexia, rash, tachycardia, urticaria.

**SIDE-EFFECTS, FURTHER INFORMATION**
- Infusion-related reactions: Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimize by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

**PREGNANCY** Manufacturer advises use with caution—limited information available.

**BREAST FEEDING** Manufacturer advises use with caution—no information available.

**MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.

**DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane® powder.

**PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (July 2010) that betaine anhydrous (Cystadane®) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

**ELECTROLYTES:** May contain Sodium Chloride 0.9% and give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution.

**Cystadane** (Orphan Europe (UK) Ltd)

Betaine 1 gram per 1 gram Cystadane oral powder, 180 gram £347.00

---

**3.5 Homocystinuria**

**METHYL DONORS**

**Betaine**

**INDICATIONS AND DOSE**

Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)

**BY MOUTH**
- Neonate: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg, adjusted according to response), maximum 150 mg/kg per day.
- Child 1 month–9 years: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response, maximum 150 mg/kg per day.
- Child 10–17 years: 3 g twice daily (max. per dose 10 g), adjusted according to response, maximum 20 g per day.

**SIDE-EFFECTS**

- Uncommon: Agitation, alopecia, anorexia, depression, gastro-intestinal disorders, personality disorder, reversible cerebral oedema, sleep disturbances, urinary incontinence, urticaria.

**PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

**BREAST FEEDING** Manufacturer advises use with caution—limited information available.

**MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.

**DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane® powder.

**PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

**3.6 Mitochondrial disorders**

**CO-ENZYMES**

**Ubidecarenone**

(Ubiquinone; Co-enzyme Q10)

**INDICATIONS AND DOSE**

**Mitochondrial disorders**
- **BY MOUTH**
  - Neonate: Initially 5 mg 1–2 times a day, adjusted according to response, dose too be taken with food, increased if necessary up to 200 mg daily.
  - Child: Initially 5 mg 1–2 times a day, adjusted according to response, dose to be taken with food, increased if necessary up to 300 mg daily.

**UNLICENSED USE** Not licensed.

**CAUTIONS** May reduce insulin requirement in diabetes mellitus.

**SIDE-EFFECTS**

- Common or very common: Diarrhoea, heartburn, nausea
- Rare: Agitation, dizziness, headache, irritability

**HEPATIC IMPAIRMENT** Reduce dose in moderate and severe impairment.
PATIENT AND CARER ADVICE

DRUG ACTION

Galsulfase is a recombinant form of human N-acetylglucosamine-4-sulfatase.

INDICATIONS AND DOSE

Mucopolysaccharidosis VI (specialist use only)

- By Intravenous infusion

- Child: 1 mg/kg in 28 minutes

- Neute: 2 mg/kg in 28 minutes

CAUTIONS

Infusion-related reactions

- Infusion-related reactions can occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30–60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during re-administration following a severe reaction.

SIDE-EFFECTS

- Common or very common
  - Abdominal pain - chills - diarrhoea - dizziness - dyspnoea - headache - hypersensitivity - infusion-related reactions - myalgia - nausea - oropharyngeal pain - pyrexia - vomiting

- Uncommon
  - Anaphylaxis

PREGNANCY

Manufacturer advises avoid unless essential—limited information available.

BREAST FEEDING

Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Vimizim®), give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 ml infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 ml/hour, then increase to a rate of 6 ml/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 ml/hour to max. 36 ml/hour; body-weight 25 kg or over, dilute requisite dose to final volume of 250 ml and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 ml/hour, then increase to a rate of 12 ml/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 ml/hour to max. 72 ml/hour.

HANDLING AND STORAGE

Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.

MEDITICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

SOLUTION FOR INTRAVENOUS INFUSION

EXCIPIENTS: May contain Polysorbates, sorbitol

ELECTROLYTES: May contain Sodium

- Vimizim (BioMarin Europe Ltd)
  - Elsulfase alfa 1 mg per 1 ml Vimizim 5mg/ml concentrate for solution for infusion vials | 1 vial £75.00

3.7 Mucopolysaccharidosis

ENZYMES

- Elsulfase alfa

  01-Sep-2016

  DRUG ACTION

  Elsulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylglucosamine-6-sulfatase (GALNS) deficiency.

  INDICATIONS AND DOSE

  Mucopolysaccharidosis IVA (specialist use only)

  - By Intravenous infusion

  - Neute: 2 mg/kg once weekly.

  - Child: 2 mg/kg once weekly

  CAUTIONS

  Infusion-related reactions

  CAUTIONS, FURTHER INFORMATION

  - Infusion-related reactions can occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30–60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during re-administration following a severe reaction.

  SIDE-EFFECTS

  - Common or very common
    - Abdominal pain - chills - diarrhoea - dizziness - dyspnoea - headache - hypersensitivity - infusion-related reactions - myalgia - nausea - oropharyngeal pain - pyrexia - vomiting

  - Uncommon
    - Anaphylaxis

  PREGNANCY

  Manufacturer advises avoid unless essential—limited information available.

  BREAST FEEDING

  Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.

  DIRECTIONS FOR ADMINISTRATION

  For intravenous infusion (Vimizim®), give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 ml infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 ml/hour, then increase to a rate of 6 ml/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 ml/hour to max. 36 ml/hour; body-weight 25 kg or over, dilute requisite dose to final volume of 250 ml and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 ml/hour, then increase to a rate of 12 ml/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 ml/hour to max. 72 ml/hour.

  HANDLING AND STORAGE

  Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.

  PATIENT AND CARER ADVICE

  Driving and skilled tasks

  Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.

  MEDITICAL FORMS

  There can be variation in the licensing of different medicines containing the same drug.

  SOLUTION FOR INTRAVENOUS INFUSION

  EXCIPIENTS: May contain Polysorbates, sorbitol

  ELECTROLYTES: May contain Sodium

  - Vimizim (BioMarin Europe Ltd)
    - Elsulfase alfa 1 mg per 1 ml Vimizim 5mg/ml concentrate for solution for infusion vials | 1 vial £75.00

Galsulfase

  DRUG ACTION

  Galsulfase is a recombinant form of human N-acetylglucosamine-4-sulfatase.

  INDICATIONS AND DOSE

  Mucopolysaccharidosis VI (specialist use only)

  - By Intravenous infusion

  - Child: 5–17 years: 1 mg/kg once weekly

  CAUTIONS

  Acute febrile illness (consider delaying treatment) - acute respiratory illness (consider delaying treatment) - infusion-related reactions can occur - respiratory disease

  SIDE-EFFECTS

  SIDE-EFFECTS, FURTHER INFORMATION

  - Infusion-related reactions can occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require
pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute requisite dose with Sodium Chloride 0.9% to a final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over at least 4 hours.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Naglazyme** (BioMarin Europe Ltd) ▼
  - Galsulfase 1 mg per 1 ml Naglazyme 5mg/5ml solution for infusion vials | 1 vial (PO) £982.00

**Idursulfase**

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

**INDICATIONS AND DOSE**

**Mucopolysaccharidosis II (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Child: 5-17 years: 500 micrograms/kg once weekly

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, alopecia, anaphylaxis, angioedema, blood pressure changes, cold extremities, cough, diarrhea, dizziness, dyspnoea, fatigue, flushing, headache, hypertension, hypotension, hypoxia, infusion-site swelling, peripheral oedema, pruritus, pyrexia, rash, swollen tongue, tachycardia, tachypnoea, tremor, urticaria, wheezing
- **Frequency not known** Anaphylaxis, infusion-related reactions, pulmonary embolism

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

**CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.

**PREGNANCY** Manufacturer advises avoid.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute requisite dose in 100 mL Sodium Chloride 0.9% and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Elaprase** (Shire Pharmaceuticals Ltd) ▼
  - idursulfase 2 mg per 1 ml Elaprase 6mg/3ml concentrate for solution for infusion vials | 1 vial (PO) £1,985.00

**Laronidase**

- **DRUG ACTION** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

**INDICATIONS AND DOSE**

**Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Child: 100 units/kg once weekly

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

**PREGNANCY** Manufacturer advises avoid unless essential—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute with Sodium Chloride 0.9%; body-weight under 20 kg, dilute to 100 mL, body-weight over 20 kg dilute to 250 mL, give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Aldurazyme** (Genzyme Therapeutics Ltd)
  - Laronidase 100 unit per 1 ml Aldurazyme 500units/5ml solution for infusion vials | 1 vial (PO) £444.70
### 3.8 Nephropathic cystinosis

#### AMINO ACIDS AND DERIVATIVES

**Mercaptamine** (Cysteamine)

- **INDICATIONS AND DOSE**
  - **Nephropathic cystinosis (specialist use only)**
  - **BY MOUTH**
    - Neonate: Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
    - Child 1 month–11 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
    - Child 12–17 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses.

- **DOSE EQUIVALENCE AND CONVERSION**
  - 1.3 g/m² is approximately equivalent to 50 mg/kg.

- **UNLICENSED USE** Mercaptamine eye drops for the management of ocular symptoms arising from the deposition of cystine crystals in the eye are not licensed.

#### IMPORTANT SAFETY INFORMATION

**SAFE PRACTICE**

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS** Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine.

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain, anorexia, breath and body odour, diarrhoea, dyspepsia, encephalopathy, fever, gastroenteritis, headache, malaise, nausea, rash, vomiting.
  - **Uncommon** Drowsiness, gastro-intestinal ulcer, hallucinations, leucopenia, nephrotic syndrome, nervousness, seizures.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to penicillamine.

- **PREGNANCY** Avoid—teratogenic and toxic in animal studies.

- **BREAST FEEDING** Avoid.

- **MONITORING REQUIREMENTS** Leucocyte–cystine concentration and haematological monitoring required—consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** For children under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice).

### 3.9 Niemann-Pick type C disease

#### ENZYME INHIBITORS > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

**Miglustat**

- **DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

- **INDICATIONS AND DOSE**
  - Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)
    - **BY MOUTH**
      - Child 4–11 years (body surface area up to 0.48 m²): 100 mg once daily
      - Child 4–11 years (body surface area 0.48–0.73 m²): 100 mg twice daily
      - Child 4–11 years (body surface area 0.74–0.88 m²): 100 mg 3 times a day
      - Child 4–11 years (body surface area 0.89–1.25 m²): 200 mg twice daily
      - Child 4–11 years (body surface area 1.26 m² and above): 200 mg 3 times a day
      - Child 12–17 years: 200 mg 3 times a day

- **SIDE-EFFECTS** Abdominal pain, anemia, anorexia, ataxia, chills, constipation, decreased libido, depression, diarrhoea, dizziness, dyspepsia, flatulence, headache, hypoesthesia, insomnia, malaise, muscle spasm, muscle weakness, nausea, paraesthesia, peripheral neuropathy, thrombocytopenia, tremor, vomiting, weight changes.

- **CONCEPTION AND CONTRAINDICATION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution.

- **RENAL IMPAIRMENT** Child 12–17 years, initially 200 mg twice daily if estimated glomerular filtration rate 50–70 mL/minute/1.73 m². Child 12–17 years, initially 100 mg twice daily if estimated glomerular filtration rate 30–50 mL/minute/1.73 m².
30–50 mL/minute/1.73 m². Avoid if estimated glomerular filtration less than 30 mL/minute/1.73 m².
Child under 12 years—consult product literature.

**MONITORING REQUIREMENTS**
- Monitor cognitive and neurological function.
- Monitor growth and platelet count in Niemann–Pick type C disease.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- **Myozyme** (Genzyme Therapeutics Ltd)
  - Alglucosidase alfa 50 mg Myozyme 50 mg powder for concentrate for solution for infusion vials | 1 vial £356.06 (Hospital only)

### 3.10 Pompe disease

**ENZYMES**

**Alglucosidase alfa**

- **DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

**INDICATIONS AND DOSE**

**Pompe disease (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - **Neonate**: 20 mg/kg every 2 weeks.
  - **Child**: 20 mg/kg every 2 weeks

**CAUTIONS** Cardiac dysfunction · infusion-related reactions—consult product literature · respiratory dysfunction

**SIDE-EFFECTS**

- **Common or very common** Agitation · anaphylaxis · antibody formation · blood pressure changes · bronchospasm · chest discomfort · cold extremities · cough · cyanosis · diarrhoea · dizziness · facial oedema · fatigue · flushing · headache · hypersensitivity reactions · injection-site reactions · irritability · muscle spasm · myalgia · nausea · paraesthesia · pruritus · pyrexia · rash · restlessness · sweating · tachycardia · tachyphoea · tremor · urticaria · vomiting

- **Frequency not known** Infusion-related reactions · necrotising skin lesions · severe skin reactions · ulcerative skin lesions

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related reactions Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

**PREGNANCY** Toxicity in animal studies, but treatment should not be withheld.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS**

- Monitor closely if cardiac dysfunction.
- Monitor closely if respiratory dysfunction.
- Monitor immunoglobulin G (IgG) antibody concentration.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with Sodium Chloride 0.9% to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

**INTERACTIONS** → Appendix 1: nitisinone

**SIDE-EFFECTS**

- **Common or very common** Conjunctivitis · corneal opacity · eye pain · granulocytopenia · keratitis · leucopenia · photophobia · thrombocytopenia
- **Uncommon** Blepharitis · erythematous rash · exfoliative dermatitis · leucocytosis · pruritus

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk— toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—adverse effects in animal studies.

**PRE-TREATMENT SCREENING** Slit-lamp examination of eyes recommended before treatment.

**MONITORING REQUIREMENTS**

- Monitor liver function regularly.
- Monitor platelet and white blood cell count every 6 months.

**DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Orfadin** (Swedish Orphan Biovitrum Ltd)

- **Nitisinone 4 mg per 1 ml** Orfadin 4 mg/1 mL oral suspension sugar-free | 90 ml £1,692.00

- **Capsule**
  - **Orfadin** (Swedish Orphan Biovitrum Ltd)
  - **Nitisinone 2 mg** Orfadin 2 mg capsules | 60 capsule £564.00
  - **Nitisinone 5 mg** Orfadin 5 mg capsules | 60 capsule £1,127.00
  - **Nitisinone 10 mg** Orfadin 10 mg capsules | 60 capsule £2,062.00
  - **Nitisinone 20 mg** Orfadin 20 mg capsules | 60 capsule £4,512.00

### 3.11 Tyrosinaemia type I

**ENZYME INHIBITORS**

**4-HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS**

**Nitisinone**

(NTBc)

**INDICATIONS AND DOSE**

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

- **BY MOUTH**
  - **Neonate**: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day.
- **Child**: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

**INTERACTIONS** → Appendix 1: nitisinone

**SIDE-EFFECTS**

- **Common or very common** Conjugatvitis · corneal opacity · eye pain · granulocytopenia · keratitis · leucopenia · photophobia · thrombocytopenia
- **Uncommon** Blepharitis · erythematous rash · exfoliative dermatitis · leucocytosis · pruritus

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk— toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—adverse effects in animal studies.

**PRE-TREATMENT SCREENING** Slit-lamp examination of eyes recommended before treatment.

**MONITORING REQUIREMENTS**

- Monitor liver function regularly.
- Monitor platelet and white blood cell count every 6 months.

**DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Orfadin** (Swedish Orphan Biovitrum Ltd)

- **Nitisinone 4 mg per 1 ml** Orfadin 4 mg/1 mL oral suspension sugar-free | 90 ml £1,692.00

  - **Nitisinone 10 mg** Orfadin 10 mg capsules | 60 capsule £2,062.00
  - **Nitisinone 20 mg** Orfadin 20 mg capsules | 60 capsule £4,512.00
3.12 Urea cycle disorders

AMINO ACIDS AND DERIVATIVES

Arginine

- **INDICATIONS AND DOSE**
  - Acute hyperammonaemia in carbamylphosphate synthetase deficiency (specialist use only) / Acute hyperammonaemia in ornithine transcarbamylase deficiency (specialist use only)
    - **BY INTRAVENOUS INFUSION**
      - Neonate: 6 mg/kg/hour.
      - Child (body-weight up to 40 kg): 6 mg/kg/hour
      - Child (body-weight 40 kg and above): 4 mg/kg/hour
  - Maintenance treatment of hyperammonaemia in carbamylphosphate synthetase deficiency (specialist use only) / Maintenance treatment of hyperammonaemia in ornithine transcarbamylase deficiency (specialist use only)
    - **BY MOUTH**
      - Neonate: 100–200 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.
      - Child (body-weight up to 20 kg): 100–200 mg/kg daily in 3–4 divided doses, dose to be given with feeds or meals
      - Child (body-weight 20 kg and above): 2.5–6 g/m² daily in 3–4 divided doses, dose to be taken with meals; maximum 6 g per day
  - **Acute hyperammonaemia in citrullinaemia (specialist use only) / Acute hyperammonaemia in arginosuccinic aciduria (specialist use only)**
    - **BY INTRAVENOUS INFUSION**
      - Neonate: Initially 300 mg/kg, to be administered over 90 minutes, followed by 12.5 mg/kg/hour, to be administered over 24 hours (maximum 25 mg/kg/hour thereafter).
      - Child (body-weight up to 40 kg): Initially 300 mg/kg, to be administered over 90 minutes, followed by 12.5 mg/kg/hour, to be administered over 24 hours (maximum 25 mg/kg/hour thereafter)
      - Child (body-weight 40 kg and above): 21 mg/kg/hour
  - Maintenance treatment of hyperammonaemia in citrullinaemia (specialist use only) / Maintenance treatment of hyperammonaemia in arginosuccinic aciduria (specialist use only)
    - **BY MOUTH**
      - Neonate: 100–300 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.
      - Child (body-weight up to 20 kg): 100–300 mg/kg daily in 3–4 divided doses, dose to be taken with feed or meals
      - Child (body-weight 20 kg and above): 2.5–6 g/m² daily in 3–4 divided doses, doses to be taken with meals; maximum 6 g per day

- **CONTRA-INDICATIONS** Not to be used in the treatment of arginase deficiency
- **SIDE-EFFECTS**
  - With intravenous use: Flushing · headache · hyperchloraemic metabolic acidosis · hypotension · irritation at injection site · nausea · numbness · vomiting
- **PREGNANCY** No information available.
- **BREAST FEEDING** No information available.

- **MONITORING REQUIREMENTS** Monitor plasma pH and chloride.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use: For intravenous infusion, dilute to a max. concentration of 50 mg/mL with glucose 10%.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - With oral use: Powder to be prescribed as a borderline substance (ACBS). For use as a supplement in urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullinaemia, arginosuccinic aciduria, and deficiency of N-acetyl glutamate synthetase.

**3.13 Wilson’s disease**

**ANTIDOTES AND CHELATORS › COPPER ABSORPTION INHIBITORS**

**Zinc acetate**

- **INDICATIONS AND DOSE**

  **Wilson’s disease (initiated under specialist supervision)**
  - **BY MOUTH**
    - Child 1–5 years: 25 mg twice daily
    - Child 6–15 years (body-weight up to 57 kg): 25 mg 3 times a day
    - Child 6–15 years (body-weight 57 kg and above): 50 mg 3 times a day
    - Child 16–17 years: 50 mg 3 times a day
  - **DOSE EQUIVALENCE AND CONVERSION**
    - Doses expressed as elemental zinc.

- **PHARMACOKINETICS**
  - Symptomatic Wilson’s disease patients should be treated initially with a chelating agent because zinc has a slow offset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS**
  - Portal hypertension (risk of hepatic decompensation when switching from chelating agent)

- **INTERACTIONS**
  - Appendix 1: zinc

- **SIDE-EFFECTS**
  - Gastric irritation (usually transient)
  - Leucopenia · sideroblastic anaemia

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.

- **PREGNANCY**
  - Usual dose 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.

- **BREAST FEEDING**
  - Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.

- **MONITORING REQUIREMENTS**
  - Monitor full blood count and serum cholesterol.
● DIRECTIONS FOR ADMINISTRATION Capsules may be opened and the contents mixed with water.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

▶ Wilzin (Orphan Europe (UK) Ltd)
Zinc (as Zinc acetate) 25 mg Wilzin 25mg capsules | 250 capsule [POM] £132.00
Zinc (as Zinc acetate) 50 mg Wilzin 50mg capsules | 250 capsule [POM] £242.00

ANTIDOTES AND CHELATORS ▶ COPPER CHELATORS

Penicillamine

● DRUG ACTION Penicillamine aids the elimination of copper ions in Wilson’s disease (hepatolenticular degeneration).

● INDICATIONS AND DOSE

Wilson’s disease

▶ BY MOUTH

▶ Child 1-month–11 years: 20 mg/kg daily in 2–3 divided doses, to be taken 1 hour before food; maximum 2 g per day

▶ Child 12–17 years: Initially 20 mg/kg daily in 2–3 divided doses. Maintenance 0.75–1 g daily, to be taken 1 hour before food; maximum 2 g per day

Cystinuria

▶ BY MOUTH

▶ Child: 20–30 mg/kg daily in 2–3 divided doses, lower doses may be used initially and increased gradually, doses to be adjusted to maintain 24-hour urinary cystine below 1 mmol/litre, maintain adequate fluid intake, to be taken 1 hour before food; maximum 3 g per day

● CONTRA-INDICATIONS Lupus erythematosus

● CAUTIONS Neurological involvement in Wilson’s disease

● INTERACTIONS ▶ Appendix 1: penicillamine

● SIDE-EFFECTS

▶ Common or very common Anorexia · fever · nausea · proteinuria · rash · thrombocytopenia

▶ Rare Alopecia · breast enlargement (male and female) · elastosis perforans · haematuria (withdrawal if cause unknown) · mouth ulceration · pseudoxanthoma · skin laxity · stomatitis

▶ Frequency not known Agranulocytosis · aplastic anaemia · blood disorders · bronchiolitis · cholestatic jaundice · dermatomyositis · glomerulonephritis · Goodpasture’s disease · haemolytic anaemia · haemolytic leucopenia · late rashes (consider dose reduction) · lupus erythematosus · myasthenia gravis · nephrotic syndrome · neuropathy (especially if neurological involvement in Wilson’s disease—prophylactic pyridoxine recommended) · neutropenia · pancreatitis · pemphigus · pneumonitis · polymyositis · pulmonary haemorrhage · rheumatoid arthritis · Stevens-Johnson syndrome · taste loss (mineral supplements not recommended) · urticaria · vomiting

● ALLERGY AND CROSS-SENSITIVITY Patients who are hypersensitive to penicillin may react rarely to penicillamine.

● PREGNANCY Fetal abnormalities reported rarely; avoid if possible.

● BREAST FEEDING Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

● RENAL IMPAIRMENT Reduce dose and monitor renal function or avoid (consult product literature).

● MONITORING REQUIREMENTS

▶ Consider withdrawal if platelet count falls below 120 000/mm³ or white blood cells below 2500/mm³ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).

▶ Monitor urine for proteinuria.

▶ Monitor blood and platelet count regularly.

● PATIENT AND CARER ADVICE Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 6, 22

▶ Penicillamine (Non-proprietary)
Penicillamine 125 mg Penicillamine 125mg tablets | 56 tablet [POM] £45.00 DT price = £45.00
Penicillamine 250 mg Penicillamine 250mg tablets | 56 tablet [POM] £88.70 DT price = £88.75
Distamine (Alliance Pharmaceuticals Ltd) Penicillamine 125 mg Distamine 125mg tablets | 100 tablet [POM] £10.34
Penicillamine 250 mg Distamine 250mg tablets | 100 tablet [POM] £17.78

Trientine dihydrochloride

● INDICATIONS AND DOSE

Wilson’s disease in patients intolerant of penicillamine

▶ BY MOUTH

▶ Child 2–11 years: Initially 0.6–1.5 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

▶ Child 12–17 years: 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

● INTERACTIONS ▶ Appendix 1: trientine

● SIDE-EFFECTS

▶ Common or very common Nausea · rash · vomiting

▶ Very rare Anaemia

▶ Frequency not known Colitis · duodenitis

● PREGNANCY Teratogenic in animal studies—use only if benefit outweighs risk. Monitor maternal and neonatal serum-copper concentrations.

● PRESCRIBING AND DISPENSING INFORMATION Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

4 Mineral and trace elements deficiencies

4.1 Zinc deficiency

Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease, or in zinc-losing states.

Zinc is used in the treatment of Wilson’s disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc, see also Intravenous nutrition below. If necessary, further zinc can be added to intravenous feeding regimens.

5 Nutrition (Intravenous)

**Intravenous nutrition**

Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to oral or enteral tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Complete enteral starvation is undesirable and total parenteral nutrition is a last resort.

Indications for parenteral nutrition include prematurity; severe or prolonged disorders of the gastro-intestinal tract; preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; major surgery, trauma, or burns; prolonged coma or inability to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations used in children is given under Proprietary Infusion Fluids for Parenteral Feeding p. 591.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, lipids, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of an amino-acid, glucose, electrolyte bag, and a separate lipid infusion or, in older children a single ‘all-in-one’ bag. If the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of nutritional solutions of low osmolality and neutral pH. Nutritional fluids should be given by a dedicated intravenous line; if not possible, compatibility with any drugs or fluids should be checked as precipitation of components may occur. Extravasation of parenteral nutrition solution can cause severe tissue damage and injury; the infusion site should be regularly monitored.

Before starting intravenous nutrition the patient should be clinically stable and renal function and acid-base status should be assessed. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment. The nutritional components of parenteral nutrition regimens are usually increased gradually over a number of days to prevent metabolic complications and to allow metabolic adaptation to the infused nutrients. The solutions are usually infused over 24 hours but this may be gradually reduced if long-term nutrition is required. Home parenteral nutrition is usually infused over 12 hours overnight.

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and
management of parenteral nutrition complications, specialist literature should be consulted.

Protein (nitrogen) is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes. Solutions for use in neonates and children under 1 year of age are based on the amino acid profile of umbilical cord blood (Primene®) or breast milk (Vaminolact®) and contain amino acids that are essential in this age group; these amino acids may not be present in sufficient quantities in preparations designed for older children and adults.

Energy requirements must be met if amino acids are to be utilised for tissue maintenance. An appropriate energy to protein ratio is essential and requirements will vary depending on the child’s age and condition. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose p. 564 is the preferred source of carbohydrate, but frequent monitoring of blood glucose is required particularly during initiation and build-up of the regimen; insulin may be necessary. Glucose above a concentration of 12.5% must be infused through a central venous catheter to avoid thrombosis; the maximum concentration of glucose that should normally be infused in fluid restricted children is 20–25%.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphorylation of glucose and to prevent hypophosphataemia. Neonates, particularly preterm neonates, and young children also require phosphorus and calcium to ensure adequate bone mineralisation. The compatibility and solubility of calcium and phosphorus salts is complex and unpredictable; precipitation is a risk and specialist pharmacy advice should be sought.

Fat (lipid) emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation.
Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Regular monitoring of plasma cholesterol and triglyceride is necessary to ensure clearance from the plasma, particularly in conditions where fat metabolism may be disturbed e.g. infection. Emulsions containing 20% or 30% fat should be used in neonates as they are cleared more efficiently. Additives should not be mixed with fat emulsions unless compatibility is known.

Electrolytes are usually provided as the chloride salts of potassium and sodium. Acetate salts can be used to reduce the amount of chloride infused; hyperchloremic acidosis or hypochloremic alkalosis can occur in preterm neonates or children with renal impairment.

Administration
Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases specialist pharmacy advice, product literature and other specialist literature should be consulted.

NUTRIENTS ▶ PARENTERAL NUTRITION

Parenteral nutrition supplements

- INDICATIONS AND DOSE
  Dipeptiven 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES
  Amino acid supplement for hypercatabolic or hypermetabolic states
  ▶ BY INTRAVENOUS INFUSION
  ▶ Child: 300-400 mg/kg daily, dose not to exceed 20% of total amino acid intake

- CAUTIONS
  Peditrace Solution for infusion 10ML VIALS Reduced biliary excretion - reduced biliary excretion in cholestatic liver disease - reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required) - total parenteral nutrition exceeding one month

CAUTIONS, FURTHER INFORMATION
  Total parenteral nutrition exceeding one month Measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment — discontinue if manganese concentration raised or if cholestasis develops.

- DIRECTIONS FOR ADMINISTRATION
  Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases specialist pharmacy advice, product literature, and other specialist literature should be consulted. Compatibility with the infusion solution must be ascertained before adding supplementary preparations. Additives should not be mixed with fat emulsions unless compatibility is known.

Cernevitr Solution for injection vials and diluent
Cernevitr solution contains dl-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecaciferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, panthenolic acid (as dexpantenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydroxide sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg.

Peditrace Solution for infusion 10ML VIALS For use in neonates (when kidney function established, usually second day of life), infants, and children.

Peditrace solution contains traces of Zn²⁺, Cu²⁺, Mn²⁺, Se⁴⁺, F⁻, I⁻.

Decan Concentrate for solution for infusion 40ML BOTTLES. For patients over 40 kg.
Decan solution contains trace elements Fe²⁺, Zn²⁺, Cu²⁺, Mn²⁺, F⁻, Co²⁺, I⁻, Se⁴⁺, Mo⁶⁺, Cr³⁺.

Addiphos VIALS Addiphos® sterile solution contains phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL.

Dipeptiven 20G/100ML Concentrate for solution for infusion bottles Dipeptiven® solution contains N(2)–L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg).

Addittrace Solution for infusion 10ML Ampoules For patients over 40 kg.
Addittrace solution contains traces of Fe²⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, F⁻, I⁻.

Glycophos VIALS Glycophos® Sterile Concentrate solution contains phosphate 20 mmol, Na⁺ 40 mmol/20 mL.

Solivito N Powder for solution for infusion vials Solivito N (as palmitate) infant emulsion contains vitamin A 230 units, ergocalciferol 40 units, dl-alpha tocopherol 0.7 unit, phytomenadione 20 micrograms/mL.

Vitlipid N Infant Emulsion for injection 10ML Ampoules Vitlipid N® infant emulsion contains vitamin A 330 units, ergocalciferol 20 units, dl-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL.

For成人和儿童超过11岁。
● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection
- Cernevit (Baxter Healthcare Ltd)
  Cyanocobalamin 6 microgram, Biotin 69 microgram, Folic acid 414 microgram, Thiamine 3.51 mg, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Panthenol (as Dexamphenol) 17.25 mg, Nicotinamide 46 mg, Ascorbic acid 125 mg, Alpha tocopherol 11.2 unit, Colecalciferol 220 unit, Retinol 3500 unit
  Cernevit solution for injection vials and diluent
  10 vial (Pb) no price available

Solution for infusion
- Parenteral nutrition supplements (Non-proprietary)
  Sodium glycophosphate 216 mg per 1 ml
  Sodium glycophosphate 4.32g/20ml concentrate for solution for infusion vials
  1 vial (Pb) £0.07
  10 vial (Pb) no price available
- Additrace (Fresenius Kabi Ltd)
  Sodium molybdate 4.85 microgram per 1 ml, Chromic chloride 5.33 microgram per 1 ml, Sodium selenite 10.5 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Manganese chloride 99 microgram per 1 ml, Sodium fluoride 210 microgram per 1 ml, Copper chloride 340 microgram per 1 ml, Ferric chloride 544 microgram per 1 ml, Zinc chloride 1.36 mg per 1 ml
  Additrace solution for infusion 10ml ampoules
  1 ampoule (Pb) £1.96
  20 ampoule (Pb) no price available
- Dipeptiven (Fresenius Kabi Ltd)
  N(2)-L-alanyl-L-glutamine 200 mg per 1 ml
  Dipeptiven 20g/100ml
  1 bottle (Pb) £25.93
  10 bottle (Pb) no price available
- Peditrace (Fresenius Kabi Ltd)
  Manganese (as Manganese chloride) 1 microgram per 1 ml, Iodine (as Potassium iodide) 1 microgram per 1 ml, Selenium (as Sodium selenite) 2 microgram per 1 ml, Copper (as Copper chloride) 20 microgram per 1 ml, Fluoride (as Sodium fluoride) 57 microgram per 1 ml, Zinc (as Zinc chloride) 250 microgram per 1 ml
  Peditrace solution for infusion 10ml vials
  1 vial (Pb) £3.55
  10 vial (Pb) no price available
- Tracutil (B. Braun Melsungen AG)
  Sodium molybdate dihydrate 2.42 microgram per 1 ml, Chromic chloride 5.3 microgram per 1 ml, Sodium selenite pentahydrate 7.89 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Sodium fluoride 126 microgram per 1 ml, Manganese chloride 197.9 microgram per 1 ml, Copper chloride 204.6 microgram per 1 ml, Zinc chloride 681.5 microgram per 1 ml, Ferrous chloride 695.8 microgram per 1 ml
  Tracutil concentrate for solution for infusion 10ml ampoules
  5 ampoule (Pb) £7.96

Powder for solution for infusion
- Solivito N (Fresenius Kabi Ltd)
  Cyanocobalamin 5 microgram, Biotin 60 microgram, Folic acid 400 microgram, Thiamine nitrate 3.1 mg, Pyridoxine hydrochloride 4.9 mg, Riboflavin sodium phosphate 4.9 mg, Sodium pantothenate 16.5 mg, Nicotinamide 40 mg, Sodium ascorbate 113 mg
  Solivito N powder for solution for infusion vials
  1 vial (Pb) £1.97
  10 vial (Pb) no price available

Emulsion for injection
- Vitlipid N Adult (Fresenius Kabi Ltd)
  Ergocalciferol 500 nanogram per 1 ml, Phytomenadione 15 microgram per 1 ml, Retinol palmitate 99 microgram per 1 ml, Alpha tocopherol 910 microgram per 1 ml
  Vitlipid N Adult emulsion for injection 10ml ampoules
  1 ampoule (Pb) £1.97
  10 ampoule (Pb) no price available
- Vitlipid N Infant (Fresenius Kabi Ltd)
  Ergocalciferol 1 microgram per 1 ml, Phytomenadione 20 microgram per 1 ml, Retinol palmitate 69 microgram per 1 ml
  Vitlipid N Infant emulsion for injection 10ml ampoules
  1 ampoule (Pb) £1.97
  10 ampoule (Pb) no price available

6 Nutrition (oral)

Enteral nutrition

Overview
Children have higher nutrient requirements per kg bodyweight, different metabolic rates, and physiological responses compared to adults. They have low nutritional stores and are particularly vulnerable to growth and nutritional problems during critical periods of development. Major illness, operations, or trauma impose increased metabolic demands and can rapidly exhaust nutritional reserves.

Every effort should be made to optimise oral food intake before beginning enteral tube feeding; this may include change of posture, special seating, feeding equipment, oral desensitisation, food texture changes, thickening of liquids, increasing energy density of food, treatment of reflux or oesophagitis, as well as using age-specific nutritional supplements.

Enteral tube feeding has a role in both short-term rehabilitation and long-term nutritional management in paediatrics. It can be used as supportive therapy, in which the enteral feed supplies a proportion of the required nutrients, or as primary therapy, in which the enteral feed delivers all the necessary nutrients. Most children receiving tube feeds should also be encouraged to take oral food and drink. Tube feeding should be considered in the following situations:

- unsafe swallowing and risk of aspiration
- inability to consume at least 60% of energy needs by mouth
- total feeding time of more than 4 hours per day
- weight loss or no weight gain for a period of 3 months (less for younger children and infants)
- weight for height (or length) less than 2nd percentile for age and sex

Most feeds for enteral use contain protein derived from cows’ milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for children who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in the clinically unstable child. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

Choosing the best formula for children depends on several factors including: nutritional requirements, gastro-intestinal function, underlying disease, nutrient restrictions, age, and feed characteristics (nutritional composition, viscosity, osmolality, availability and cost). Children have specific dietary requirements and in many situations liquid feeds prepared for adults are totally unsuitable and should not be given. Expert advice from a dietician should be sought before prescribing enteral feeds for a child.

Infant formula feeds

Child 0–12 months. Term infants with normal gastro-intestinal function are given either breast milk or normal infant formula during the first year of life. The average intake is between 150 mL and 200 mL/kg/day. Infant milk formulas are based on whey- or casein-dominant protein, lactose with or without maltodextrin, amylose, vegetable oil and milk fat. The composition of all normal and soya infant formulas have to meet The Infant Formula and Follow-on Formula Regulations (England and Wales) 2007, which enact
the European Community Regulations 2006/141/EC; the composition of other enteral and specialist feeds has to meet the Commission Directive (1999/21/EC) on Dietary Foods for Special Medical Purposes.

A high-energy feed, which contains 9–11% of energy derived from protein can be used for infants who fail to grow adequately. Alternatively, energy supplements may be added to normal infant formula to achieve a higher energy content (but this will reduce the protein to energy ratio) or the normal infant formula concentration may be increased slightly. Care should be taken not to present an osmotic load of more than 500 milliosmols/kg water to the normal functioning gut, otherwise osmotic diarrhoea will result. Concentrating or supplementing feeds should not be attempted without the advice of a paediatric dietician.

Enteral feeds

Child 1–6 years (body-weight 8–20 kg). Ready-to-use feeds based on caseinates, maltodextrin and vegetable oils (with or without added medium chain triglyceride (MCT) oil or fibre) are well tolerated and effective in improving nutritional status in this age group. Although originally designed for children 1–6 years (body-weight 8–20 kg), some products have ACBS approval for use in children weighing up to 30 kg (approx. 10 years of age). Enteral feeds formulated for children 1–6 years are low in sodium and potassium; electrolyte intake and biochemical status should be monitored. Older children in this age range taking small feed volumes may need to be given additional micronutrients. Fibre-enriched feeds may be helpful for children with chronic constipation or diarrhoea.

Child 7–12 years (body-weight 21–45 kg). Depending on age, weight, clinical condition and nutritional requirements, ready-to-use feeds formulated for 7–12 year olds may be given at appropriate rates.

Child over 12 years (body-weight over 45 kg). As there are no standard enteral feeds formulated for this age group, adult formulations are used. The intake of protein, electrolytes, vitamins, and trace minerals should be carefully assessed and monitored. Note: Adult feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be used with caution and expert advice.

Specialised formula

It is essential that any infant who is intolerant of breast milk or normal infant formula, or whose condition requires nutrient-specific adaptation, is prescribed an adequate volume of a nutritionally complete replacement formula. In the first 4 months of life, a volume of 150–200 mL/kg/day recommended. After 6 months, should the formula still be required, a volume of 600 mL/day should be maintained, in addition to solid food.

Products for cow’s milk protein intolerance or lactose intolerance. There are a number of infant formulas formulated for cow’s milk protein intolerance or lactose intolerance; these feeds may contain a residual amount of lactose (less than 1 g/100 mL formula)—sometimes described as clinically lactose-free or ‘lactose-free’ by manufacturers. If the total daily intake of these formula is low, it may be necessary to supplement with calcium, and a vitamin and mineral supplement.

Soya-based infant formulas have a high phytoestrogen content and this may be a long-term reproductive health risk. The Chief Medical Officer has advised that soya-based infant formulas should not be used as the first choice for the management of infants with proven cow’s milk sensitivity, lactose intolerance, galactokinase deficiency and galactosaemia. Most UK paediatricians with expertise in inherited metabolic disease still advocate soya-based formulations for infants with galactosaemia as there are concerns about the residual lactose content of low lactose formulas and protein hydrolysates based on cow’s milk protein.

Low lactose infant formulations, based on whole cow’s milk protein, are unsuitable for children with cow’s milk protein intolerance. Liquid soya milks purchased from supermarkets and health food stores are not nutritionally complete and should never be used for infants under 1 year of age.

Protein hydrolysate formulas. Non-milk, peptide-based feeds containing hydrolysates of casein, whey, meat and soya protein, are suitable for infants with disaccharide or whole protein intolerance. The total daily intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet the child’s nutritional requirements; these feeds have a high osmolality when given at recommended dilution and need gradual and careful introduction.

Elemental (amino acid based formula). Specially formulated elemental feeds containing essential and nonessential amino acids are available for use in infants and children under 6 years with proven whole protein intolerance. Adult elemental formula may be used for children over 6 years; the intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet nutritional requirements. These feeds have a high osmolality when given at the recommended concentration and therefore need gradual and careful introduction.

Modular feeds. Modular feeds (see Specialised Formulas for Specific Clinical Conditions) are based on individual protein, fat, carbohydrate, vitamin and mineral components or modules which can be combined to meet the specific needs of a child. Modular feeds are used when nutritionally complete specialised formula are not tolerated, or if the fluid and nutrient requirements change e.g. in gastro-intestinal, renal or liver disease. The main advantage of modular feeds is their flexibility; disadvantages include their complexity and preparation difficulties. Modular feeds should not be used without the supervision of a paediatric dietician.

Specialised formula. Highly specialised formulas are designed to meet the specific requirements in various clinical conditions such as renal and liver diseases. When using these formulas, both the biochemical status of the child and their growth parameters need to be monitored.

Feed thickeners

Carob based thickeners may be used to thicken feeds for infants under 1 year with significant gastro-oesophageal reflux. Breast-fed infants can be given the thickener mixed to a paste with water or breast-milk prior to feeds.

Pre-thickened formula Milk-protein- or casein-dominant infant formula, which contains small quantities of pre-gelatinized starch, is recommended primarily for infants with mild gastro-oesophageal reflux. Pre-thickened formula is prepared in the same way as normal infant formula and flows through a standard teat. The feeds do not thicken on standing but thicken in the stomach when exposed to acid pH.

Starched based thickeners can be used to thicken liquids and feeds for children over 1 year of age with dysphagia.

Dietary supplements for oral use

Three types of prescribable fortified dietary supplements are available: fortified milk and non-milk tasting (juice-style) drinks, and fortified milk-based semi-solid preparations. The recommended daily quantity is age-dependent. The following is a useful guide: 1–2 years, 200 kcal (840 kJ); 3–5 years, 400 kcal (1600 kJ); 6–11 years, 600 kcal (2520 kJ); and over 12 years, 800 kcal (3360 kJ). Supplements containing 1.5 kcal/mL are high in protein and should not be used for children under 3 years of age. Many supplements are high in sugar or maltodextrin; care should be taken to prevent prolonged contact with teeth. Ideally supplements should be administered after meals or at bedtime so as not to affect appetite.
Products for metabolic diseases
There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

Enteral feeding tubes
Care is required in choosing an appropriate formulation of a drug for administration through a nasogastric narrow-bore feeding tube or through a percutaneous endoscopic gastrostomy (PEG) or jejunostomy tube. Liquid preparations (or soluble tablets) are preferred; injection solutions may also be suitable for administration through an enteral tube.

If a solid formulation of a medicine needs to be given, it should be given as a suspension of particles fine enough to pass through the tube. It is possible to crush many immediate-release tablets but enteric-coated or modified-release preparations should not be crushed.

Enteral feeds may affect the absorption of drugs and it is therefore important to consider the timing of drug administration in relation to feeds. If more than one drug needs to be given, they should be given separately and the tube should be flushed with water after each drug has been given.

Clearing blockages
Carbonated (sugar-free) drinks may be marginally more effective than water in unblocking feeding tubes, but mildly acidic liquids (such as pineapple juice or cola-based drinks) can coagulate protein in feeds, causing further blockage. If these measures fail to clear the enteral feeding tube, an alkaline solution containing pancreatic enzymes may be introduced into the tube (followed after at least 5 minutes by water). Specific products designed to break up blockages caused by formula feeds are also available.

6.1 Special diets

Nutrition in special diets

Overview
These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for children who either cannot tolerate or cannot metabolise certain common constituents of food.

Coeliac disease
Coeliac disease is caused by an abnormal immune response to gluten. For management and further information, see Coeliac disease p. 33.

Phenylketonuria
Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair. Aspartame (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. If alternatives are unavailable, children with phenylketonuria should not be denied access to appropriate medication; the amount of aspartame consumed can be taken into account in the management of the condition. Where the presence of aspartame in a preparation is specified in the product literature, aspartame is listed as an excipient in the relevant product entry in BNFC for Children; the child or carer should be informed of this.

Some rare forms of phenylketonuria are caused by a deficiency of tetrahydrobiopterin. Treatment involves oral supplementation of tetrahydrobiopterin p. 596; in some severe cases, the addition of the neurotransmitter precursors, levodopa and 5-hydroxytryptophan, is also necessary.

Sapropterin dihydrochloride below, a synthetic form of tetrahydrobiopterin, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Products for metabolic diseases
There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

6.1a Phenylketonuria

DRUGS FOR METABOLIC DISORDERS

TETRAHYDROBIOPTERIN AND DERIVATIVES

Sapropterin dihydrochloride

INDICATIONS AND DOSE
Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)
- **BY MOUTH**
  - Child 4–17 years: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning

Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)
- **BY MOUTH**
  - Neonate: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day
  - Child: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

CAUTIONS
- History of convulsions
- INTERACTIONS ➔ Appendix 1: aspartame
- SIDE-EFFECTS
  - Common or very common Abdominal pain · cough · diarrhoea · headache · nasal congestion · pharyngolaryngeal pain · vomiting
  - Frequency not known Hypersensitivity reactions
- PREGNANCY Manufacturer advises caution—consider only if strict dietary management inadequate.
- BREAST FEEDING Manufacturer advises avoid—no information available.
- HEPATIC IMPAIRMENT Manufacturer advises caution—no information available.
- RENAL IMPAIRMENT Manufacturer advises caution—no information available.
- MONITORING REQUIREMENTS
  - Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response
increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.

- Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.

**DIRECTIONS FOR ADMINISTRATION** Tablets should be dissolved in water and taken within 20 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Sapropterin is a synthetic form of tetrahydrobiopterin.

**PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Soluble tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Child**: 30 tablets
- **Patient or carers**: 30 tablets

- Kuvan (BioMarin Europe Ltd)
- Sapropterin dihydrochloride 100 mg Kuvan 100mg soluble tablets sugar-free | 30 tablet [pfp] £597.22

**Tetrahydrobiopterin**

- **INDICATIONS AND DOSE**

  Monotherapy in tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)
  - **BY MOUTH**
    - Child: 10 mg/kg twice daily, adjusted according to response, total daily dose may alternatively be given in 3 divided doses
  
  In combination with neurotransmitter precursors for tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)
  - **BY MOUTH**
    - Child 1 month-1 year: Initially 250–750 micrograms/kg 4 times a day, adjusted according to response, total daily dose may alternatively be given in 3 divided doses; maximum 7 mg/kg per day
    - Child 2-17 years: Initially 250–750 micrograms/kg 4 times a day, adjusted according to response, total daily dose may alternatively be given in 3 divided doses; maximum 10 mg/kg per day

- **UNLICENSED USE** Not licensed.

- **SIDE-EFFECTS** Diarrhoea, disturbed sleep, urinary frequency

- **PREGNANCY** Crosses the placenta; use only if benefit outweighs risk.

- **BREAST FEEDING** Present in milk, effects unknown.

- **RENTAL IMPAIRMENT** Use with caution—accumulation of metabolites.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.
  No licensed medicines listed.

---

**Vitamin deficiency**

**Vitamins**

**Overview**

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements. Except for iron-deficiency anaemia, a primary vitamin or mineral deficiency due to simple dietary inadequacy is rare in the developed world. Some children may be at risk of developing deficiencies because of an inadequate intake, impaired vitamin synthesis or malabsorption in disease states such as cystic fibrosis and Crohn’s disease.

The use of vitamins as general ‘pick-me-ups’ is of unproven value and, the ‘fad’ for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid p. 602 and pyridoxine hydrochloride p. 600, is unscientific and can be harmful. Many vitamin supplements are described as ‘multivitamin’ but few contain the whole range of essential vitamins and many contain relatively high amounts of vitamins A and D. Care should be taken to ensure the correct dose is not exceeded.

**Dental patients**

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

**Vitamin A**

Deficiency of vitamin A (retinol) p. 599 is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin A supplementation may be required in children with liver disease, particularly cholestatic liver disease, due to the malabsorption of fat soluble vitamins. In those with complete biliary obstruction an intramuscular dose once a month may be appropriate.

Preterm neonates have low plasma concentrations of vitamin A and are usually given vitamin A supplements, often as part of an oral multivitamin preparation once enteral feeding has been established.

**Vitamin B group**

Deficiency of the B vitamins, other than vitamin B12, is rare in the UK and is usually treated by preparations containing thiamine (B1) p. 601, and riboflavin (B2). Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate, and pantothenic acid or panthenol may be included in vitamin B preparations, but there is no evidence of their value as supplements; however, they can be used in the management of certain metabolic disorders. Anaphylaxis has been reported with parenteral B vitaminc.

As with other vitamins of the B group, pyridoxine hydrochloride (B6) deficiency is rare, but it may occur during isoniazid p. 352 therapy or penicillamine p. 589 treatment in Wilson’s disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, cystathioninuria and homocystinuria; folic acid p. 546 supplementation may also be beneficial in these disorders. Pyridoxine hydrochloride is also used in sideroblastic anaemia. Rarely, seizures in the neonatal period or during infancy respond to pyridoxine hydrochloride treatment; pyridoxine hydrochloride should be tried in all cases of early–onset intractable seizures and status epilepticus. Pyridoxine hydrochloride has been tried for a wide variety of other
disorders, but there is little sound evidence to support the claims of efficacy. A number of mitochondrial disorders may respond to treatment with certain B vitamins but these disorders require specialist management. Thiamine is used in the treatment of maple syrup urine disease, mitochondrial respiratory chain defects and, together with riboflavin, in the treatment of congenital lactic acidosis; riboflavin is also used in glutaric acidemia and cytochrome oxidase deficiencies; biotin is used in carboxylase defects. Folic acid and vitamin B₁₂ are used in the treatment of megaloblastic anaemia. Folinic acid is used in carboxylase defects.

Vitamin C (ascorbic acid) therapy is essential in scurvy, but supplementation with phosphate or calcium may be required. Hypophosphataemic rickets occurs due to abnormal phosphate excretion; treatment with high doses of oral phosphate, and hydroxylated (activated) forms of vitamin D allow bone mineralisation and optimise growth.

Nutritional deficiency of vitamin D is best treated with colecalciferol or ergocalciferol. Preparations containing calcium and colecalciferol are also occasionally used in children where there is evidence of combined calcium and vitamin D deficiency. Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses; the hypocalcaemia of hypoparathyroidism often requires higher doses in order to achieve normalocaemia and alfalcacidol is generally preferred.

Vitamin D supplementation is often given in combination with calcium supplements for persistent hypocalcaemia in neonates, and in chronic renal disease. Vitamin D requires hydroxylation, by the kidney and liver, to its active form therefore the hydroxylated derivatives alfalcacidol or calcitriol should be prescribed if patients with severe liver or renal impairment require vitamin D therapy. Alfalcacidol is generally preferred in children as there is more experience of its use and appropriate formulations are available. Calcitriol is unlicensed for use in children and is generally reserved for those with severe liver disease.

Vitamin E

The daily requirement of vitamin E (tocopherol) has not been well defined. Vitamin E supplements are given to children with fat malabsorption such as in cystic fibrosis and cholestatic liver disease. In children with abetalipoproteinaemia abnormally low vitamin E concentrations may occur in association with neuromuscular problems; this usually responds to high doses of vitamin E. Some neonatal units still administer a single intramuscular dose of vitamin E at birth to preterm neonates to reduce the risk of complications; no trials of long-term outcome have been carried out. The intramuscular route should also be considered in children with severe liver disease when response to oral therapy is inadequate. Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone. Because vitamin K is fat soluble, children with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. For oral administration to prevent vitamin K deficiency in malabsorption syndromes, a water-soluble synthetic vitamin K derivative, menadione sodium phosphate p. 609 can be used if supplementation with phytoenadione p. 609 by mouth has been insufficient. Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects can be antagonised by giving vitamin K; see advice on the use of vitamin K in haemorrhage.

Multivitamins

Multivitamin supplements are used in children with vitamin deficiencies and also in malabsorption conditions such as cystic fibrosis or liver disease. Supplementation is not required if nutrient enriched feeds are used; consult a dietician for further advice.

Neonates

Vitamin K deficiency bleeding

Neonates are relatively deficient in vitamin K and those who do not receive supplements of vitamin K are at risk of serious
bleeding including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). An appropriate regimen should be selected after discussion with parents in the antenatal period. Vitamin K (as phytomenadione) may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies. Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione by mouth at birth (using the contents of a phytomenadione capsule) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

VITAMINS AND TRACE ELEMENTS

VITAMINS A and D

- **INDICATIONS AND DOSE**
  - **Prevention of vitamin A and D deficiency**
    - By mouth
    - Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D

- **SIDE-EFFECTS**
  - Overdose: Excessive ingestion. Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - This drug contains vitamin D; consult individual vitamin D monographs.

- **UNLICENSED USE**
  - Not licensed in children under 6 months of age.

VITAMINS A, B group, C and D

- **INDICATIONS AND DOSE**
  - **Prevention of deficiency**
    - By mouth using capsules
    - Child 1–11 years: 1 capsule daily
    - Child 1–17 years: 2 capsules daily

  - **Cystic Fibrosis: prevention of deficiency**
    - By mouth using capsules
    - Child 1–17 years: 2–3 capsules daily

- **EXCIPIENTS**:
  - Capsule
    - ABIDEC Multivitamin: Vitamin A 4000 unit, Vitamin D 400 unit, Vitamins A and D.
  - Dalivit Oral Drops: Vitamins A, B group, C and D.

- **UNLICENSED USE**
  - Dalavit® not licensed for use in children under 6 weeks.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - This drug contains vitamin D; consult individual vitamin D monographs.
  - To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.
  - Vitamin A concentration of preparations varies.

- **UNDERTAKEN USE**
  - Not licensed in children under 6 weeks.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - This drug contains vitamin D; consult individual vitamin D monographs.
  - To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.
  - Vitamin A concentration of preparations varies.

- **UNLICENSED USE**
  - Not licensed in children under 6 weeks.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - This drug contains vitamin D; consult individual vitamin D monographs.
  - To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.
  - Vitamin A concentration of preparations varies.

- **UNLICENSED USE**
  - Not licensed in children under 6 weeks.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - This drug contains vitamin D; consult individual vitamin D monographs.
  - To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.
  - Vitamin A concentration of preparations varies.

- **UNLICENSED USE**
  - Not licensed in children under 6 weeks.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - This drug contains vitamin D; consult individual vitamin D monographs.
  - To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.
  - Vitamin A concentration of preparations varies.
Vitamins A, C and D

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A below, ascorbic acid p. 602.

- **INDICATIONS AND DOSE**
  - Prevention of vitamin deficiency
    - BY MOUTH
      - Child 1 month-4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

- **INTERACTIONS** → Appendix 1: ascorbic acid, vitamin A
- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.
  - Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

  Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: drops, solution for injection

  **Solution for injection**
  - Vitamin A (Non-proprietary) Retinol (as Vitamin A palmitate) 50000 unit per 1 ml Vitamin A 100,000 units/2ml solution for injection ampoules | 6 ampoule PoM no price available
  - Drops
    - Vitamin A (Non-proprietary) Vitamin A 150,000 unit per 1 ml Arovit 150,000 units/ml drops | 75 ml PoM no price available

  Combinations available: Vitamins A, C and D, above

VITAMINS AND TRACE ELEMENTS ➔ VITAMIN A

Vitamin A
(Retinol)

- **INDICATIONS AND DOSE**
  - Vitamin A deficiency
    - BY MOUTH
      - Neonate: 5000 units daily, higher doses may be used initially for treatment of severe deficiency.
      - Child 1-11 months: 5000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
      - Child 1-7 years: 10,000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
  - Prevention of deficiency in complete biliary obstruction
    - BY INTRAMUSCULAR INJECTION
      - Neonate: 50,000 units once a month.
      - Child 1-11 months: 50,000 units once a month

- **UNLICENSED USE** Preparations containing only vitamin A are not licensed.
- **INTERACTIONS** → Appendix 1: vitamin A

- **SIDE-EFFECTS**
  - Overdose
    - Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.
  - **PREGNANCY** Excessive doses may be teratogenic. In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver paté or liver sausage.
  - **BREAST FEEDING** Theoretical risk of toxicity in infants of mothers taking large doses.
  - **MONITORING REQUIREMENTS** Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: drops, solution for injection

  **Solution for injection**
  - Vitamin A (Non-proprietary) Retinol (as Vitamin A palmitate) 50000 unit per 1 ml Vitamin A 100,000 units/2ml solution for injection ampoules | 6 ampoule PoM no price available
  - Drops
    - Vitamin A (Non-proprietary) Vitamin A 150,000 unit per 1 ml Arovit 150,000 units/ml drops | 75 ml PoM no price available

  Combinations available: Vitamins A, C and D, above

Biotin
(Vitamin H)

- **INDICATIONS AND DOSE**
  - **Isolated carboxylase defects**
    - Neonate: 5 mg once daily, adjusted according to response, maintenance 10–50 mg daily, higher doses may be required.
    - Child: 10 mg once daily, adjusted according to response; maintenance 10–50 mg daily, increased if necessary up to 100 mg daily
  - **Defects of biotin metabolism**
    - Neonate: Initially 10 mg once daily, adjusted according to response; maintenance 5–20 mg daily, higher doses may be required.
    - Child: Initially 10 mg once daily, adjusted according to response; maintenance 5–20 mg daily, higher doses may be required

- **PREGNANCY** No information available.
- **BREAST FEEDING** No information available.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, tablets may be crushed and mixed with food or drink.
- **PATIENT AND CARER ADVICE**

Blood and nutrition 9
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection.

**Solution for injection**
- **Biotin (Non-proprietary)**
  - Biotin 5 mg per 1 ml
  - Biotin 10 mg per 1 ml

**Tablet**
- **Biotin (Non-proprietary)**
  - Biotin 5 mg | 10 mg | 50 mg | 100 mg
- **OroB (Rhodes Pharma Ltd)**
  - Biotin 5 mg | 10 mg | 50 mg | 100 mg

**Pyridoxine hydrochloride**
**(Vitamin B<sub>6</sub>)**

**INDICATIONS AND DOSE**
- **Isoniazid-induced neuropathy (prophylaxis)**
  - BY MOUTH
    - Neonate: 5 mg daily.
    - Child 1 month–11 years: 5–10 mg daily
    - Child 12–17 years: 10 mg daily
- **Isoniazid-induced neuropathy (treatment)**
  - BY MOUTH
    - Neonate: 5–10 mg daily.
    - Child 1 month–11 years: 10–20 mg 2–3 times a day
    - Child 12–17 years: 30–50 mg 2–3 times a day
- **Prevention of penicillamine-induced neuropathy in Wilson’s disease**
  - BY MOUTH
    - Child 1–11 years: 5–10 mg daily
    - Child 12–17 years: 10 mg daily
- **Metabolic diseases | Cystathioninuria | Homocystinuria**
  - BY MOUTH
    - Neonate: 50–100 mg 1–2 times a day.
    - Child: 50–250 mg 1–2 times a day
- **Pyridoxine-dependent seizures**
  - INITIALLY BY INTRAVENOUS INJECTION
    - Neonate: Test dose 50–100 mg, repeated if necessary, if responsive, followed by an oral maintenance dose; (by mouth) maintenance 50–100 mg once daily, dose to be adjusted as necessary.
    - Child 1 month–11 years: Test dose 50–100 mg daily, if responsive, followed by an oral maintenance dose, (by mouth) maintenance 20–50 mg 1–2 times a day, dose to be adjusted as necessary, (by mouth) increased if necessary up to 1 g daily

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection.

**Tablet**
- **Pyridoxine hydrochloride (Non-proprietary)**
  - Pyridoxine hydrochloride 10 mg | 50 mg | 100 mg tablets
  - Pyridoxine hydrochloride 10 mg | 50 mg | 100 mg solution for injection

**Solution for injection**
- **Pyridoxine hydrochloride (Non-proprietary)**
  - Pyridoxine hydrochloride 25 mg per 1 ml
  - Pyridoxine hydrochloride 50 mg per 1 ml

**Capsule**
- **Pyridoxine hydrochloride (Non-proprietary)**
  - Pyridoxine hydrochloride 100 mg

**Riboflavin**
**(Riboflavin; Vitamin B<sub>2</sub>)**

**INDICATIONS AND DOSE**
- **Metabolic diseases**
  - BY MOUTH
    - Neonate: 50 mg 1–2 times a day, adjusted according to response.
    - Child: 50–100 mg 1–2 times a day, adjusted according to response to up to 400 mg daily

- **UNLICENSED USE**
  - Not licensed in children.
  - **SIDE-EFFECTS**
    - Bright yellow urine
  - **PREGNANCY**
    - Crosses the placenta but no adverse effects reported, information at high doses limited.
  - **BREAST FEEDING**
    - Present in breast milk but no adverse effects reported, information at high doses limited.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, modified-release tablet, capsule, oral suspension, oral solution.

**Modified-release tablet**
- **Riboflavin (Non-proprietary)**
  - Riboflavin 100 mg

**Tablet**
- **Riboflavin (Non-proprietary)**
  - Riboflavin 10 mg
  - Riboflavin 100 mg

**Capsule**
- **Riboflavin (Non-proprietary)**
  - Riboflavin 50 mg
  - Riboflavin 100 mg

---

**Side-effects**
- Sensory neuropathy (with high doses when given for extended periods)
- Overdose
  - Overdosage induces toxic effects.

## Thiamine

**(Vitamin B₁)**

### Indications and Dose

**Maple syrup urine disease**
- **By Mouth**

**Neonate**: 5 mg/kg daily, dose to be adjusted as necessary.

**Child**: 5 mg/kg daily, dose to be adjusted as necessary.

**Metabolic disorders | Congenital lactic acidosis**
- **By Mouth, or by Intravenous infusion**

**Neonate**: 50–200 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes.

**Child**: 100–300 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes, increased if necessary up to 2 g daily.

### Unlicensed Use

Not licensed in children.

### Important Safety Information

**MHRA/CHM Advice (September 2007)**

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

### Caution

Anaphylaxis may occasionally follow injection.

### Side-Effects

- With intravenous use
- Hypersensitivity reactions

### Breast Feeding

Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.

### Prescribing and Dispensing Information

- With intravenous use
- Some preparations may contain phenol as a preservative.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**
- **Thiamine (Non-proprietary)**
  - Thiamine hydrochloride 100 mg Vitamin B1 100mg modified-release tablets | 90 tablet P £4.18

**Tablet**
- **Thiamine (Non-proprietary)**
  - Thiamine hydrochloride 25 mg Vitamin B1 25mg tablets | 100 tablet P no price available
  - Thiamine hydrochloride 50 mg Thiamine 50mg tablets | 28 tablet P £1.80–£2.00 | 100 tablet P £7.14 DT price = £7.14
  - Thiamine hydrochloride 100 mg Thiamine 100mg tablets | 28 tablet P £2.50–£2.80 | 100 tablet P £10.00 DT price = £10.00

## Vitamin B complex

### Indications and Dose

**Vigranon B® Syrup**

**Treatment of deficiency**
- **By Mouth**
  - Child 1–11 months: 5 mL 3 times a day
  - Child 1–11 years: 10 mL 3 times a day
  - Child 12–17 years: 10–15 mL 3 times a day

**Prophylaxis of deficiency**
- **By Mouth**
  - Child 1–11 months: 5 mL once daily
  - Child 1–11 years: 5 mL twice daily
  - Child 12–17 years: 5 mL 3 times a day

### National Funding/Access Decisions

**NHS restrictions**

Vigranon B® syrup is not prescribable under the National Health Service (NHS).

**Less Suitable for Prescribing**

Vigranon B® syrup is less suitable for prescribing.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**
- **Vigranon-B** (Wallace Manufacturing Chemists Ltd)
  - Pyridoxine hydrochloride 400 microgram per 1 mL, Riboflavin sodium phosphate 548 microgram per 1 mL, Dexamethasone 600 microgram per 1 mL, Thiamine hydrochloride 1 mg per 1 mL, Nicotinamide 4 mg per 1 mL Vigranon-B syrup sugar-free | 150 ml P £26.00

## Vitamins with minerals and trace elements

### Indications and Dose

**Forceval® Capsules**

Vitamin and mineral deficiency and as adjunct in synthetic diets
- **By Mouth**
  - Child 12–17 years: 1 capsule daily, one hour after a meal

**Ketovite® Liquid**

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets
- **By Mouth**
  - Child: 5 mL daily, dose adjusted according to condition, diet, or age, use with Ketovite® Tablets for complete vitamin supplementation.
KETOVITE® TABLETS
Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets
▶ BY MOUTH
▶ Child: 1 tablet 3 times a day, dose adjusted according to condition, diet, or age, use with Ketovite® Liquid for complete vitamin supplementation.

PRESCRIBING AND DISPENSING INFORMATION
To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Multivitamin preparations for vitamin deficiency www.medicinesforchildren.org.uk/multivitamin-preparations-vitamin-deficiency

KETOVITE® LIQUID
Ketovite® liquid may be mixed with milk, cereal, or fruit juice.

KETOVITE® TABLETS
Tablets may be crushed immediately before use.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Oral emulsion
▶ Vitamins with minerals and trace elements (Non-proprietary)
Cyanocobalamin 2.5 microgram per 1 ml, Choline chloride 30 mg per 1 ml, Ergocalciferol 80 unit per 1 ml, Vitamin A 500 unit per 1 ml Ketovite liquid sugar-free | 150 ml [P] £19.10

Tablet
▶ Ketovite (Essential Pharmaceuticals Ltd)
Biotin 170 microgram, Folic acid 250 microgram, Pyridoxine hydrochloride 330 microgram, Acetomenaphthone 500 microgram, Riboflavin 1 mg, Thiamine hydrochloride 1 mg, Calcium pantothenate 1.16 mg, Nicotinamide 3.3 mg, Alpha tocopherol acetate 5 mg, Ascorbic acid 16.6 mg, Inositol 50 mg
Ketovite tablets | 100 tablet [PvM] £9.21

Capsule
▶ Forceval (Alliance Pharmaceuticals Ltd)
Cyanocobalamin 3 microgram, Selenium 50 microgram, Biotin 100 microgram, Iodine 140 microgram, Chromium 200 microgram, Molybdenum 250 microgram, Folic acid 400 microgram, Thiamine 1.2 mg, Riboflavin 1.6 mg, Copper 2 mg, Pyridoxine 2 mg, Manganese 3 mg, Pantothenic acid 4 mg, Potassium 4 mg, Tocopheryl acetate 10 mg, Iron 12 mg, Zinc 15 mg, Nicotinamide 18 mg, Magnesium 30 mg, Ascorbic acid 60 mg, Phosphorus 77 mg, Calcium 100 mg, Ergocalciferol 400 unit, Vitamin A 2500 unit Forceval capsules | 15 capsule [P] £4.86 | 30 capsule [P] £8.48 | 90 capsule [P] £25.44

VITAMINS AND TRACE ELEMENTS
▶ VITAMIN C

Ascorbic acid
(Vitamin C)

INDICATIONS AND DOSE
Treatment of scurvy
▶ BY MOUTH
▶ Child 1 month–3 years: 125–250 mg daily in 1–2 divided doses
▶ Child 4–11 years: 250–500 mg daily in 1–2 divided doses
▶ Child 12–17 years: 0.5–1 g daily in 1–2 divided doses
Adjuvant to desferrioxamine (to enhance the excretion of iron 1 month after treatment)
▶ BY MOUTH
▶ Child: 100–200 mg daily, to be taken 1 hour before food

Metabolic disorders | Tyrosinaemia type III | Transient tyrosinaemia of the newborn | Glutathione synthase deficiency | Hawkinsinuria
▶ BY MOUTH
▶ Neonate: 50–200 mg daily, dose to be adjusted as necessary.
▶ Child: 200–400 mg daily in 1–2 divided doses, dose to be adjusted as necessary, increased if necessary up to 1 g daily

UNLICENSED USE
Not licensed for metabolic disorders.

CONTRA-INDICATIONS
Hyperoxaluria

CAUTIONS

CONTRA-INDICATIONS
Iron overload Ascorbic acid should not be given to patients with cardiac dysfunction.
In patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

INTERACTIONS
Appendix 1: ascorbic acid

SIDE-EFFECTS
Diarrhoea, fatigue, headache, hyperoxaluria, nausea

PRESCRIBING AND DISPENSING INFORMATION
It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for infusion

Tablet
EXCipients: May contain Aspartame

Ascorbic acid 1 gram Vitamin C 1000mg capsules | 100 capsule no price available | 250 capsule no price available

Combinations available: Vitamins A, C and D, p. 599
VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

Vitamin D and analogues (systemic)

- CONTRA-INDICATIONS Hypercalcaemia · metastatic calcification
- SIDE-EFFECTS
  - Overdose
  Symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.
- PREGNANCY High doses teratogenic in animals but therapeutic doses unlikely to be harmful.
- BREAST FEEDING Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.
- MONITORING REQUIREMENTS Important: All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

Alfacalcidol (1α-Hydroxycholecalciferol)

- INDICATIONS AND DOSE
  - Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism
    - BY MOUTH, OR BY INTRAVENOUS INJECTION
    - Child 1 month-11 years: 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day
    - Child 12-17 years: 1 microgram once daily, dose to be adjusted as necessary

- Persistent neonatal hypocalcaemia
  - BY MOUTH, OR BY INTRAVENOUS INJECTION
  - Neonate: 50–100 nanograms/kg once daily, dose to be adjusted as necessary, in resistant cases higher doses may be needed; increased if necessary up to 2 micrograms/kg daily.

- Prevention of vitamin D deficiency in renal or cholestatic liver disease
  - BY MOUTH, OR BY INTRAVENOUS INJECTION
  - Neonate: 20 nanograms/kg once daily, dose to be adjusted as necessary.

- Child 1 month-11 years (body-weight up to 20 kg): 15–30 nanograms/kg once daily (max. per dose 500 nanograms)
- Child 1 month-11 years (body-weight 20 kg and above): 250–500 nanograms once daily, dose to be adjusted as necessary
- Child 12-17 years: 250–500 nanograms once daily, dose to be adjusted as necessary

- DOSE EQUIVALENCE AND CONVERSION
  - One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

- CAUTIONS
  - Nephrolithiasis · take care to ensure correct dose in infants

- INTERACTIONS → Appendix 1: vitamin D substances

Calcitriol (1,25-Dihydroxycholecalciferol)

- INDICATIONS AND DOSE
  - Vitamin D dependent rickets | Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism | Pseudo-hypoparathyroidism (limited experience)
    - BY MOUTH
    - Child 1 month-11 years: Initially 15 nanograms/kg once daily (max. per dose 250 nanograms), increased in steps of 5 nanograms/kg daily (max. per dose 250 nanograms) if required, dose to be increased every 2–4 weeks
    - Child 12-17 years: Initially 250 nanograms once daily, increased in steps of 5 nanograms/kg daily (max. per dose 250 nanograms) if required, dose to be increased every 2–4 weeks; usual dose 0.5–1 microgram daily

- UNLICENSED USE Not licensed for use in children.
- CAUTIONS
  - Take care to ensure correct dose in infants.
- INTERACTIONS → Appendix 1: vitamin D substances
- HEPATIC IMPAIRMENT Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT Manufacturer advises avoid—no information available. Monitor plasma-calcium concentration in renal impairment.

### Oral dispersible tablet

- **Colecalciferol (Non-proprietary)**
- **Colecalciferol 2000 unit** D3 Lemon Melts 2,000 units tablets sugar-free | 120 tablet | £4.88

---

**Colecalciferol with calcium carbonate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 604, calcium carbonate p. 567.

#### INDICATIONS AND DOSE

Prevention and treatment of vitamin D and calcium deficiency

- **By mouth**
- **Child:** Dosed according to the deficit or daily maintenance requirements (consult product literature)
**UNLICENSED USE** Adcal-D® and Calceos® are not licensed for use in children under 12 years. Cacit® D3, Calchew-D®, Forte, Calchew-D3® and Kalcipos-D® are not licensed for use in children (age range not specified by manufacturers). Accrete D3® and Natecal D3® are not licensed for use in children under 18 years.

**INTERACTIONS** → Appendix 1: calcium salts, vitamin D substances

**PRESCRIBING AND DISPENSING INFORMATION** Accrete D3®
contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units); Adcal-D3® tablets contain calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units); Cacit® D3 tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units); Calchew-D3® tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 5 micrograms (200 units); Calchew-D3® Forte tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units); Calchew-D3® 500 mg/400 unit caplets contain calcium carbonate (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 10 micrograms (400 units); Kalcipos-D® contains calcium carbonate (calcium 500 mg or Ca²⁺ 12.5 mmol), colecalciferol 20 micrograms (800 units); Natecal D3® contains calcium carbonate 1.5 g (calcium 600 mg or Ca²⁺ 15 mmol), colecalciferol 10 micrograms (400 units); consult product literature for details of other available products.

Flavours of chewable and soluble forms may include orange, lemon, aniseed, peppermint, molasses, or tutti-frutti.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Effervescent granules**

**CAUTIONARY AND ADVISORY LABELS 13**

- **Colecalciferol with calcium carbonate (Non-proprietary)**
  - Calcium carbonate 2.5 gram, Colecalciferol 880 unit: Colecalciferol 880 unit / Calcium carbonate 2.5g effervescent granules sachets | 24 sachet (£0.00) no price available
  - Cacit D3 (Teva UK Ltd)
  - Calcium carbonate 1.25 gram, Colecalciferol 440 unit: Cacit D3 effervescent granules sachets | 30 sachet (£4.06) DT price = £4.06

**Effervescent tablet**

**CAUTIONARY AND ADVISORY LABELS 13**

- **Adcal-D3® (Kyowa Kirin Ltd)**
  - Calcium carbonate 1.5 gram, Colecalciferol 400 unit: Adcal-D3 Dissolve 1500mg/400unit effervescent tablets | 56 tablet (£5.99) DT price = £5.99

**Tablet**

**EXCIPIENTS:** May contain Propylene glycol

- **Colecalciferol with calcium carbonate (Non-proprietary)**
  - Calcium carbonate 400 mg, Colecalciferol 100 unit: Calcium & Vitamin D tablets | 30 tablet no price available | 60 tablet no price available
  - Accrete D3® (Internis Pharmaceuticals Ltd)

  - Adcal-D3® (Kyowa Kirin Ltd)
  - Calcium carbonate 750 mg, Colecalciferol 200 unit: Adcal-D3 750mg/300unit caplets | 112 tablet (£2.95) DT price = £2.95
  - Calchew D3® (Forum Health Products Ltd)
  - Calcium carbonate 1.25 gram, Colecalciferol 400 unit: Calchew D3 500mg/400unit caplets | 100 tablet (£7.43) DT price = £7.43
  - Kalcipos-D® (Meda Pharmaceuticals Ltd)
  - Calcium carbonate 1.25 gram, Colecalciferol 800 unit: Kalcipos-D 500mg/800unit tablets | 30 tablet (£4.21) DT price = £4.21

**Chewable tablet**

**CAUTIONARY AND ADVISORY LABELS 24**

**EXCIPIENTS:** May contain Aspartame

- **Colecalciferol with calcium carbonate (Non-proprietary)**
  - Calcium carbonate 1.25 gram, Colecalciferol 400 unit: Colecalciferol 400unit / Calcium carbonate 1.25g chewable tablets | 100 tablet (£14.75)
  - Calcium carbonate 1.5 gram, Colecalciferol 400 unit: Colecalciferol 400unit / Calcium carbonate 1.5g chewable tablets | 56 tablet (£3.65) DT price = £3.65 | 60 tablet (£4.38)
  - Adcal-D3® (Kyowa Kirin Ltd)
  - Calcium carbonate 1.5 gram, Colecalciferol 400 unit: Adcal-D3 Lemon chewable tablets | 56 tablet (£3.65) DT price = £3.65 | 112 tablet (£7.49)
  - Calcice (Galen Ltd)
  - Calcium carbonate 1.25 gram, Colecalciferol 400 unit: Calcice 500mg/400unit chewable tablets | 60 tablet (£3.88) DT price = £4.24
  - Calci-D® (Consilient Health Ltd)
  - Calcium carbonate 2.5 gram, Colecalciferol 1000 unit: Calci-D 1000mg/1000unit chewable tablets | 28 tablet (£2.25) DT price = £2.25
  - Calchew D3® (Forum Health Products Ltd)
  - Calcium carbonate 2.5 gram, Colecalciferol 800 unit: Calchew D3 1000mg/800unit Once Daily chewable tablets | 30 tablet (£6.75) DT price = £6.75
  - Calcium carbonate 1.25 gram, Colecalciferol 200 unit: Calchew D3 chewable tablets | 100 tablet (£7.68) DT price = £7.68
  - Calchew D3® Forte (Forum Health Products Ltd)
  - Calcium carbonate 1.25 gram, Colecalciferol 400 unit: Calchew D3 Forte chewable tablets | 60 tablet (£4.24) DT price = £4.24 | 100 tablet (£7.08)
  - Evacal D3 (Teva UK Ltd)
  - Calcium carbonate 1.5 gram, Colecalciferol 400 unit: Evacal D3 1500mg/400unit chewable tablets | 56 tablet (£2.75) DT price = £3.65 | 112 tablet (£5.50)
  - Kalcipos-D® (Meda Pharmaceuticals Ltd)
  - Calcium carbonate 1.25 gram, Colecalciferol 800 unit: Kalcipos-D 500mg/800unit chewable tablets | 30 tablet (£4.21) DT price = £4.21
  - Natecal® (Chiesi Ltd)
  - Calcium carbonate 1.5 gram, Colecalciferol 400 unit: Natecal D3 600mg/400unit chewable tablets | 60 tablet (£3.63
  - Theicai-D® (Stirling Angilin Pharmaceuticals Ltd)
  - Calcium carbonate 2.5 gram, Colecalciferol 880 unit: Theicai-D 1000mg/880unit chewable tablets | 30 tablet (£2.95) DT price = £2.95

**Colecalciferol with calcium phosphate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalciferol p. 604, calcium phosphate p. 568.

**INDICATIONS AND DOSE**

**Calcium and vitamin D deficiency**

- **BY MOUTH**
  - Child: (consult product literature)

**INTERACTIONS** → Appendix 1: calcium salts, vitamin D substances

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder**

**CAUTIONARY AND ADVISORY LABELS 13, 21**

- **Calfovit D3® (A. Menarini Farmaceutica Internazionale SRL)**
  - Calcium phosphate 3.1 gram, Colecalciferol 800 unit: Calfovit D3 oral powder sachets | 30 sachet (£4.32) DT price = £4.32
Ergocalciferol (Calciferol; Vitamin D₂)

- **INDICATIONS AND DOSE**
  - Nutritional vitamin-D deficiency rickets
    - **BY MOUTH**
    - Child 1–5 months: 3000 units daily, dose to be adjusted as necessary
    - Child 6 months–11 years: 6000 units daily, dose to be adjusted as necessary
    - Child 12–17 years: 10 000 units daily, dose to be adjusted as necessary
  - Nutritional or physiological supplement | Prevention of rickets
    - **BY MOUTH**
    - Neonate: 400 units daily.
    - Child: 400–600 units daily
  - Vitamin D deficiency in intestinal malabsorption or in chronic liver disease
    - **BY MOUTH, OR BY INTRAMUSCULAR INJECTION**
    - Child 1–11 years: 10 000–25 000 units daily, dose to be adjusted as necessary
    - Child 12–17 years: 10 000–40 000 units daily, dose to be adjusted as necessary

- **CAUTIONS** Take care to ensure correct dose in infants
- **INTERACTIONS** → Appendix 1: vitamin D substances
- **RENAI IMPAIRMENT** Monitor plasma–calcium concentration in renal impairment.
- **MONITORING REQUIREMENTS** Monitor plasma–calcium concentration in patients receiving high doses.
- **PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when calciferol is prescribed or demanded, colecalciferol or ergocalciferol should be dispensed or supplied.
  - When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection
  - **Tablet**
    - Ergocalciferol (Non-proprietary)
      - Ergocalciferol 12.5 microgram
        - Ergocalciferol 12.5 microgram tablets | 30 tablet no price available | 60 tablet £3.74
      - Ergoral (Cubic Pharmaceuticals Ltd)
        - Ergocalciferol 125 microgram
          - Ergoral D2 5,000 unit tablets | 30 tablet £19.95
        - Ergocalciferol 250 microgram
          - Ergoral D2 10,000 unit tablets | 30 tablet £23.95
  - **Solution for injection**
    - Ergocalciferol (Non-proprietary)
      - Ergocalciferol 300000 unit per 1 ml
        - Ergocalciferol 300,000 units/1 ml solution for injection ampoules | 10 ampoule | £93.50 DT price = £93.50
      - Ergocalciferol 400000 unit per 1 ml
        - Sterogyl 15H
          - 600,000 units/1.5 ml solution for injection ampoules | 1 ampoule | no price available
  - **Oral solution**
    - Ergocalciferol (Non-proprietary)
      - Ergocalciferol 1500 unit per 1 ml
        - Uvesterol D 1,500 units/ml oral solution sugar-free | 20 ml | no price available
      - Ergocalciferol 20000 unit per 1 ml
        - Sterogyl 100,000 units/5 ml oral solution | 20 ml | no price available DT price = £72.68
    - Eciferol (Rhodes Pharma Ltd)
      - Ergocalciferol 3000 unit per 1 ml
        - Eciferol D2 3,000 units/ml liquid | 60 ml £55.00 DT price = £102.44

**Capsule**
- Ergocalciferol (Non-proprietary)
  - Ergocalciferol 1.25 mg
    - Ergocalciferol 1.25 mg capsules | 30 capsule | no price available | 50 capsule | £23.00
  - Eciferol (Rhodes Pharma Ltd)
    - Ergocalciferol 1.25 mg
      - Eciferol D2 50,000 unit capsules | 10 capsule £29.99
  - Ergoral (Cubic Pharmaceuticals Ltd)
    - Ergocalciferol 1.25 mg
      - Ergoral D2 50,000 unit capsules | 10 capsule £19.95

**Ergocalciferol with calcium lactate and calcium phosphate**

(Calcium and vitamin D)  

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol above, calcium lactate p. 568.

- **INDICATIONS AND DOSE**
  - Prevention of calcium and vitamin D deficiency | Treatment of calcium and vitamin D deficiency
    - **BY MOUTH**
    - Child: (consult product literature)
  - **UNLICENSED USE** Calcium and Ergocalciferol tablets not licensed for use in children under 6 years.
  - **INTERACTIONS** → Appendix 1: calcium salts, vitamin D substances
  - **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed before administration, or may be chewed.
  - **PRESCRIBING AND DISPENSING INFORMATION** Each tablet contains calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca²⁺ 2.4 mmol), ergocalciferol 10 micrograms (400 units).
  - **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer calcium and ergocalciferol tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Ergocalciferol with calcium lactate and calcium phosphate (Non-proprietary)
      - Ergocalciferol 10 microgram, Calcium phosphate 150 mg, Calcium lactate 300 mg
      - Calcium and Ergocalciferol tablets | 28 tablet | £18.50 DT price = £18.26 | 500 tablet | no price available

**VITAMINS AND TRACE ELEMENTS > VITAMIN E**

**Alpha tocopherol**

(Tocopherol)

- **INDICATIONS AND DOSE**
  - Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis
    - **BY MOUTH USING ORAL SOLUTION**
    - Neonate: 17 mg/kg daily, dose to be adjusted as necessary.
    - Child: 17 mg/kg daily, dose to be adjusted as necessary
  - **CONTRA-INDICATIONS** Preterm neonates
  - **CAUTIONS** Predisposition to thrombosis
  - **INTERACTIONS** → Appendix 1: vitamin E substances
  - **SIDE-EFFECTS**
    - Common or very common: Diarrhoea
Alpha tocopheryl acetate (Tocopherol)

- **INDICATIONS AND DOSE**
  - **Vitamin E deficiency**
    - **BY MOUTH**
      - Neonate: 10 mg/kg once daily.
      - Child: 2–10 mg/kg daily, increased if necessary up to 20 mg/kg/day
  - **Malabsorption in cystic fibrosis**
    - **BY MOUTH**
      - Child 1–11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
      - Child 1–11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
      - Child 12–17 years: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

- **Vitamin E deficiency in cholestasis and severe liver disease**
  - **BY MOUTH**
    - Neonate: 10 mg/kg daily.
    - Child 1 month–11 years: Initially 100 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily
    - Child 12–17 years: Initially 200 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily

- **BY INTRAMUSCULAR INJECTION**
  - Neonate: 10 mg/kg once a month.
  - Child: 10 mg/kg once a month (max. per dose 100 mg)

- **Malabsorption in abetalipoproteinaemia**
  - **BY MOUTH**
    - Neonate: 100 mg/kg once daily.
    - Child: 50–100 mg/kg once daily

- **CAUTIONS**
  - Increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg or in a preterm neonate with predisposition to thrombosis

- **INTERACTIONS**
  - Appendix 1: vitamin E substances

- **SIDE-EFFECTS**
  - Abdominal pain (particularly with high doses) · diarrhoea (particularly with high doses)

- **PREGNANCY**
  - No evidence of safety of high doses.

- **BREAST FEEDING**
  - Excreted in milk; minimal risk, although caution with large doses.

- **MONITORING REQUIREMENTS**
  - Increased bleeding tendency in vitamin-K deficient patients or those taking anticoagulants (prothrombin time and INR should be monitored).

- **DIRECTIONS FOR ADMINISTRATION**
  - In neonates Consider dilution of oral suspension for use in neonates due to high osmolality.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**
- **Vedrop** (Orphan Europe (UK) Ltd)
  - D-alpha tocopherol (as Tocofersolan) 50 mg per 1 ml

**Alpha tocopherol 400 unit capsules**
- 100 capsule £5.04
VITAMINS AND TRACE ELEMENTS ▶ VITAMIN K

Menadiol sodium phosphate

▪ INDICATIONS AND DOSE
Supplementation in vitamin K malabsorption
▶ BY MOUTH
▪ Child 1-11 years: 5–10 mg daily, dose to be adjusted as necessary
▪ Child 12-17 years: 10–20 mg daily, dose to be adjusted as necessary

▪ CONTRA-INDICATIONS
Infants • neonates

▪ CAUTIONS
G6PD deficiency (risk of haemolysis) • vitamin E deficiency (risk of haemolysis)

▪ PREGNANCY
Avoid in late pregnancy and labour unless benefit outweighs risk of neonatal haemolytic anaemia, hyperbilirubinaemia, and kernicterus in neonate.

▪ MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Tablet
▶ Konakion MM (proprietary)
Menadiol sodium phosphate (as Menadiol sodium phosphate)
10 mg Menadiol 10mg tablets | 100 tablet £185.90 DT price = £85.90

Phytomenadione
(Vitamin K₃)

▪ INDICATIONS AND DOSE
Neonatal prophylaxis of vitamin-K deficiency bleeding
▶ BY INTRAMUSCULAR INJECTION
▪ Preterm neonate: 400 micrograms/kg (max. per dose 1 mg) for 1 dose, to be given at birth, the intravenous route may be used in preterm neonates with very low birth-weight if intramuscular injection is not possible, however, it may not provide the prolonged protection of the intramuscular injection, any neonate receiving intravenous vitamin K should be given subsequent oral doses.

▪ Neonate: 1 mg for 1 dose, to be given at birth.

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at particular risk of bleeding disorders
▶ BY MOUTH USING CAPSULES
▪ Neonate: 1 mg for 1 dose at birth (to protect from the risk of vitamin K deficiency bleeding in the first week).

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at particular risk of bleeding disorders (exclusively breast-fed babies)
▶ BY MOUTH USING CAPSULES
▪ Neonate: Initially 1 mg for 1 dose at birth, then 1 mg every week for 12 weeks.

Neonatal hypoprothrombinemia | Vitamin-K deficiency bleeding
▶ BY INTRAVENOUS INJECTION
▪ Neonate: 1 mg every 8 hours if required.

Neonatal biliary atresia and liver disease
▶ BY MOUTH
▪ Neonate: 1 mg daily.

Reversal of coumarin anticoagulation when continued anticoagulation required or if no significant bleeding—seek specialist advice
▶ BY INTRAVENOUS INJECTION
▪ Child: 15–30 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may be repeated as necessary

Reversal of coumarin anticoagulation when anticoagulation not required or if significant bleeding—seek specialist advice | Treatment of haemorrhage associated with vitamin-K deficiency—seek specialist advice
▶ BY INTRAVENOUS INJECTION
▪ Child: 250–300 micrograms/kg (max. per dose 10 mg) for 1 dose

KONAKION® MM PAEDIATRIC
Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at risk of bleeding disorders
▶ BY MOUTH
▪ Neonate: Initially 2 mg for 1 dose at birth, then 2 mg after 4–7 days.

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at risk of bleeding disorders (exclusively breast fed babies)
▶ BY MOUTH
▪ Neonate: Initially 2 mg for 1 dose at birth, then 2 mg after 4–7 days for a further 1 dose, then 2 mg for a further 1 dose 1 month after birth.

▪ CAUTIONS
Intravenous injections should be given very slowly—risk of vascular collapse

KONAKION® MM PAEDIATRIC
Parenteral administration in premature infant or neonate of less than 2.5 kg (increased risk of kernicterus)

▪ SIDE-EFFECTS
KONAKION® MM Anaphylactoid reactions

▪ PREGNANCY
Use if potential benefit outweighs risk.

▪ BREAST FEEDING
Present in milk.

▪ HEPATIC IMPAIRMENT
KONAKION® MM Caution—glycocholic acid may displace bilirubin.

▪ DIRECTIONS FOR ADMINISTRATION
▶ With oral use in neonates. The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given.

KONAKION® MM PAEDIATRIC KONAKION® MM Paediatric may be administered by mouth or by intramuscular injection or by intravenous injection.
For intravenous injection, may be diluted with Glucose 5% if necessary.

KONAKION® MM KONAKION® MM Paediatric may be administered by slow intravenous injection or by intravenous infusion in glucose 5%; not for intramuscular injection.

▪ MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, drops.

Tablet
▶ Konakion (Non-proprietary)
Phytomenadione 100 microgram Vitamin K1 100microgram tablets | 30 tablet no price available

Solution for injection
EXCIPIENTS: May contain Glycocholic acid, lecithin
▶ Konakion MM (Roche Products Ltd)
Phytomenadione 10 mg per 1 ml Konakion MM Paediatric 2mg/0.2ml solution for injection ampoules | 5 ampoule £4.71
Neural tube defects (prevention in pregnancy)

Prevention in pregnancy

Folic acid supplements p. 546 taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement daily (at low-risk group dose) before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.

- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines.

- Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid daily (at high-risk group dose) and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid (or to increase the dose to high-risk group daily dose) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

1 Arthritis

Juvenile idiopathic arthritis

Management

Rheumatic diseases require symptomatic treatment to relieve pain, swelling, and stiffness, together with treatment to control and suppress disease activity. Treatment of juvenile idiopathic arthritis may involve Non-steroidal anti-inflammatory drugs (NSAIDs) p. 621, a disease modifying anti-rheumatic drug (DMARD) such as methotrexate p. 517 or a cytokine modulator, and intra-articular, intravenous, or oral corticosteroids.

Rheumatic disease, suppressing drugs

Overview

Certain drugs, such as methotrexate p. 517, cytokine modulators, and sulfasalazine p. 30, are used to suppress the disease process in juvenile idiopathic arthritis (juvenile chronic arthritis); these drugs are known as disease-modifying antirheumatic drugs (DMARDs). In children, disease modifying antirheumatic drugs should be used under specialist supervision.

Some children with juvenile idiopathic arthritis do not require disease-modifying antirheumatic drugs. Methotrexate is effective in juvenile idiopathic arthritis; sulfasalazine is an alternative but should be avoided in systemic-onset juvenile idiopathic arthritis. Gold and penicillamine p. 589 are no longer used. Cytokine modulators have a role in polyarticular juvenile idiopathic arthritis.

Unlike NSAIDs, disease-modifying antirheumatic drugs can affect the progression of disease but they may require 3–6 months of treatment for a full therapeutic response. Response to a disease-modifying antirheumatic drug may allow the dose of the NSAID to be reduced.

Disease-modifying antirheumatic drugs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations. They reduce the erythrocyte sedimentation rate and C-reactive protein.

Antimalarials

The antimalarial hydroxychloroquine sulfate p. 612 is rarely used to treat juvenile idiopathic arthritis. Hydroxychloroquine sulfate can also be useful for systemic or discoid lupus erythematosus, particularly involving the skin and joints, and in sarcoidosis.

Retinopathy rarely occurs provided that the recommended doses are not exceeded.

Mepacrine hydrochloride is used on rare occasions to treat discoid lupus erythematosus [unlicensed].

Drugs affecting the immune response

Methotrexate, given as a once weekly dose, is the disease-modifying antirheumatic drug of choice in the treatment of juvenile idiopathic arthritis and also has a role in juvenile dermatomyositis, vasculitis, uveitis, systemic lupus erythematosus, localised scleroderma, and sarcoidosis; for these indications it is given by the subcutaneous, oral, or rarely, the intramuscular route. Absorption from intramuscular or subcutaneous routes may be more predictable than from the oral route; if the oral route is ineffective subcutaneous administration is generally preferred. Folic acid may reduce mucosal or gastro-intestinal side-effects of methotrexate. The dosage regimen for folic acid p. 546 has not been established—in children over 2 years a weekly dose [unlicensed indication], may be given on a different day from the methotrexate.

Azathioprine p. 495 may be used in children for vasculitis which has failed to respond to other treatments, for the management of severe cases of systemic lupus erythematosus and other connective tissue disorders, in conjunction with corticosteroids for patients with severe or progressive renal disease, and in cases of polymyositis which are resistant to corticosteroids. Azathioprine has a corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive.

Ciclosporin is rarely used in juvenile idiopathic arthritis, connective tissue diseases, vasculitis, and uveitis; it may be considered if the condition has failed to respond to other treatments.

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab p. 614, etanercept p. 616, and infliximab p. 31 inhibit the activity of tumour necrosis factor alpha (TNF-α). Adalimumab can be used for the management of active polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis. Etanercept is licensed for the treatment of the following subtypes of juvenile idiopathic arthritis: polyarticular juvenile idiopathic arthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, oligoarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, psoriatic arthritis in children over 12 years who have had an inadequate response to methotrexate or cannot tolerate it, and enthesitis-related arthritis in children over 12 years.
who have had an inadequate response to conventional therapy or cannot tolerate it. Infliximab has been used in refractory polyarticular juvenile idiopathic arthritis [unlicensed indication] when other treatments, such as etanercept, have failed.

Abatacept p. 614 prevents the full activation of T-lymphocytes; it can be used for the management of active polyarticular juvenile idiopathic arthritis. Abatacept is not recommended for use in combination with TNF inhibitors.

Canakinumab p. 502 inhibits the activity of interleukin-1 beta (IL-1β) and is licensed for the treatment of active systemic juvenile idiopathic arthritis in children over 2 years, when there has been an inadequate response to NSAIDs and systemic corticosteroids.

Tocilizumab p. 613 antagonises the actions of interleukin-6; it can be used for the management of active systemic juvenile idiopathic arthritis when there has been an inadequate response to NSAIDs and systemic corticosteroids and polyarticular juvenile idiopathic arthritis when there has been an inadequate response to methotrexate. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated. Tocilizumab is not recommended for use with other cytokine modulators.

**Sulfasalazine**

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity associated with some forms of juvenile idiopathic arthritis; it is generally not used in systemic-onset disease.

**Other drugs used for Arthritis** Diclofenac potassium, p. 622 • Diclofenac sodium, p. 623 • Etoricoxib, p. 624 • Flurbiprofen, p. 625 • Ibuprofen, p. 625 • Indomethacin, p. 628 • Ketoprofen, p. 629 • Meloxicam, p. 630 • Naproxen, p. 631 • Piroxicam, p. 632

---

**DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS**

## Hydroxychloroquine sulfate

**INDICATIONS AND DOSE**

Active rheumatoid arthritis (including juvenile idiopathic arthritis) (administered on expert advice) / Systemic and discoid lupus erythematosus (administered on expert advice) / Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

- **BY MOUTH**
  - Child: 5–6.5 mg/kg once daily (max. per dose 400 mg), dose given based on ideal body-weight

**UNLICENSED USE** Plaquenil® not licensed for use in children for dermatological conditions caused or aggravated by sunlight.

**CAUTIONS** Acute porphyrias p. 577 • diabetes (may lower blood glucose) • GoP deficit • may aggravate myasthenia gravis • may exacerbate psoriasis • neurological disorders (especially in those with a history of epilepsy) • severe gastro-intestinal disorders

**SCREENING, FURTHER INFORMATION**

- Screening for ocular toxicity Hydroxychloroquine is rarely associated with ocular toxicity. The British Society for Paediatric and Adolescent Rheumatology recommends that children should have their vision tested before long-term treatment with hydroxychloroquine and have an annual review of visual acuity. Children should be referred to an ophthalmologist if there is visual impairment, changes in visual acuity, or blurred vision. The Royal College of Ophthalmologists has recommended that a locally agreed protocol between the prescribing doctor and ophthalmologist be established to monitor the vision of these children. A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with hydroxychloroquine (Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009); this includes the recommendation that a child treated for juvenile idiopathic arthritis should receive slit-lamp examination routinely to check for uveitis.

**INTERACTIONS** → Appendix 1: hydroxychloroquine

**SIDE-EFFECTS**

- **Common or very common** Gastro-intestinal disturbances • headache • pruritus • rashes • skin reactions

- **Uncommon** Convulsions • discoloration of skin, nails, and mucous membranes • ECG changes • hair depigmentation • hair loss • keratopathy • ototoxicity • retinal damage • visual changes

- **Rare** Acute generalised exanthematous pustulosis • agranulocytosis • aplastic anaemia • blood disorders • cardiomyopathy • emotional disturbances • exfoliative dermatitis • hepatic damage • mental changes • myopathy • neuromyopathy • photosensitivity • psychosis • Stevens–Johnson syndrome • thrombocytopenia

**Frequency not known** Angioedema • bronchospasm

**Overdose** Hydroxychloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

**PREGNANCY** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

**BREAST FEEDING** Avoid—risk of toxicity in infant.

**HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.

**RENAL IMPAIRMENT** Manufacturer advises caution. Monitor plasma-hydroxychloroquine concentration in severe renal impairment.

**PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

**PATIENT AND CARER ADVICE** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, tablets, modified-release tablets, capsules, injection.

**Tablet**

| QUINORIC (Johnson & Johnson) | Quinoric 200mg tablets | 60 tablet | £7.12 DT price = £3.64 |
| QUINORIC (Bristol Laboratories Ltd) | Hydroxychloroquine sulfate 200 mg | 60 tablet | £7.12 DT price = £3.64 |
| PLAQENIL® (Sanofi) | Hydroxychloroquine sulfate 200 mg | 60 tablet | £5.15 DT price = £3.64 |
| PLAQENIL® (Sanofi) | Hydroxychloroquine sulfate 200 mg | 60 tablet | £5.15 DT price = £3.64 |
Tocilizumab

**INDICATIONS AND DOSE**

Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have had an inadequate response to NSAIDs and systemic corticosteroids

- **BY INTRAVENOUS INFUSION**
  - Child 2-17 years (body-weight up to 30 kg): 12 mg/kg every 2 weeks, review treatment if no improvement within 6 weeks
  - Child 2-17 years (body-weight 30 kg and above): 8 mg/kg every 2 weeks, review treatment if no improvement within 6 weeks

Polyarticular juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have had an inadequate response to methotrexate

- **BY INTRAVENOUS INFUSION**
  - Child 2-17 years (body-weight up to 30 kg): 10 mg/kg every 4 weeks, review treatment if no improvement within 12 weeks
  - Child 2-17 years (body-weight 30 kg and above): 8 mg/kg every 4 weeks, review treatment if no improvement within 12 weeks

**CONTRA-INDICATIONS** Do not initiate if absolute neutrophil count less than 2 x 10^9/litre or severe active infection

**CAUTIONS** History of diverticulitis, history of intestinal ulceration, history of recurrent or chronic infection (interrupt treatment if serious infection occurs), low absolute neutrophil count, low platelet count, predisposition to infection (interrupt treatment if serious infection occurs)

**CAUTIONS, FURTHER INFORMATION**

- Tuberculosis: Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.

**INTERACTIONS** Appendix 1: monoclonal antibodies

**SIDE-EFFECTS**

- **Common or very common** Headache, hypercholesterolaemia, infection, neutropenia, raised hepatic transaminases, upper respiratory-tract infection
- **Frequency not known** Antibody formation, diarrhoea, infusion related reactions, nausea, thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**

- Neutrophil and platelet counts: Discontinue if absolute neutrophil count less than 0.5 x 10^9/litre or platelet count less than 50 x 10^9/microlitre.

**CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 3 months after treatment.

**PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution—consult product literature.

**RENAL IMPAIRMENT** Manufacturer advises monitor renal function closely in moderate or severe impairment.

**PRE-TREATMENT SCREENING**

Tuberculosis: Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**

- Monitor lipid profile 4–8 weeks after starting treatment and then as indicated.
- Monitor for demyelinating disorders.
- Monitor hepatic transaminases.
- Monitor neutrophil and platelet counts.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion; body-weight less than 30 kg, dilute requisite dose to a volume of 50 ml with Sodium chloride 0.9% and give over 1 hour; body-weight over 30 kg, dilute requisite dose to a volume of 100 ml with Sodium chloride 0.9% and give over 1 hour.

**PATIENT AND CARER ADVICE** An alert card should be provided.

- Patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Tocilizumab for the treatment of systemic juvenile idiopathic arthritis (December 2011) NICE TA238

Tocilizumab is recommended for the treatment of systemic juvenile idiopathic arthritis in children aged over 2 years who have not responded adequately to NSAIDs, systemic corticosteroids and methotrexate, if the manufacturer makes tocilizumab available with the discount agreed as part of the patient access scheme.

Tocilizumab is not recommended for the treatment of systemic juvenile idiopathic arthritis in children whose disease continues to respond to methotrexate or who have not been treated with methotrexate.

Children currently receiving tocilizumab for systemic juvenile idiopathic arthritis who do not meet these criteria should have the option to continue treatment until it is considered appropriate to stop.

www.nice.org.uk/TA238

- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Tocilizumab is recommended as an option for treatment of polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in children 2 years and older whose disease has responded inadequately to previous therapy with methotrexate and if the manufacturer provides tocilizumab with the discounts agreed in the patient access schemes.

www.nice.org.uk/TA373

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **RoActemra** (Roche Products Ltd)
  - Tocilizumab 20 mg per 1 ml RoActemra 400mg/20ml concentrate for solution for infusion vials | 1 vial (£26.00) (Hospital only)
  - RoActemra 200mg/10ml concentrate for solution for infusion vials | 1 vial (£25.00) (Hospital only)

- **RoActemra** 80mg/4ml concentrate for solution for infusion vials | 1 vial (£102.40) (Hospital only)
IMMUNOSUPPRESSANTS > T-CELL ACTIVATION INHIBITORS

Abatacept

● INDICATIONS AND DOSE
Moderate to severe active polyarticular juvenile idiopathic arthritis (in combination with methotrexate) in children who have not responded adequately to other disease-modifying antirheumatic drugs (including at least one tumour necrosis factor (TNF) inhibitor)
▶ BY INTRAVENOUS INFUSION
  ▶ Child 6–17 years (body-weight up to 75 kg): 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months
  ▶ Child 6–17 years (body-weight 75-100 kg): 750 mg every 2 weeks for 3 doses, then 750 mg every 4 weeks, review treatment if no response within 6 months
  ▶ Child 6–17 years (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses, then 1 g every 4 weeks, review treatment if no response within 6 months

● CONTRA-INDICATIONS
  Severe infection

● CAUTIONS
  Children should be brought up to date with current immunisation schedule before initiating therapy. Do not initiate until active infections are controlled • predisposition to infection (screen for latent tuberculosis and viral hepatitis) • progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)

● INTERACTIONS
  ▶ Appendix 1: abatacept

● SIDE-EFFECTS
  ▶ Common or very common
    Abdominal pain • conjunctivitis • cough • diarrhoea • dizziness • dyspepsia • fatigue • flushing • headache • hypertension • infection • leucopenia • nausea • pain in extremities • paraesthesia • stomatitis • vomiting
  ▶ Uncommon
    Psoriasis • alopecia • anxiety • arthralgia • basal and squamous cell carcinoma • bradycardia • bronchospasm • bruising • depression • dry eye • dry skin • dyspnoea • gastritis • hyperhidrosis • hypotension • menstrual disturbances • palpitation • skin papilloma • sleep disorder • tachycardia • thrombocytopenia • visual disturbance • weight gain
  ▶ Frequency not known
    Lung cancer • lymphoma

● CONCEPTION AND CONTRACEPTION
  Effective contraception required during treatment and for 14 weeks after last dose.

● PREGNANCY
  Manufacturer advises avoid unless essential.

● BREAST FEEDING
  Present in milk in animal studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.

● DIRECTIONS FOR ADMINISTRATION
  For intravenous infusion, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
▶ Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015)
NICE TA373
Abatacept is recommended as options for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 6 years and older whose disease has responded inadequately to other disease-modifying anti-rheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor, only if the manufacturer provides abatacept with the discounts agreed in the patient access schemes.

Powder for solution for infusion
ELECTROLYTES: May contain Sodium
▶ Orencia (Bristol-Myers Squibb Pharmaceuticals Ltd)
  Abatacept 250 mg Orencia 250mg powder for concentrate for solution for infusion vials | 1 vial | £302.40 (Hospital only)

IMMUNOSUPPRESSANTS > TUMOR NECROSIS FACTOR ALPHA (TNF-α) INHIBITORS

Adalimumab

● INDICATIONS AND DOSE
Severe chronic plaque psoriasis in children who have had an inadequate response to, or are inappropriate for topical therapy and phototherapies
▶ BY SUBCUTANEOUS INJECTION
  ▶ Child 4–17 years: Initially 0.8 mg/kg every week (max. per dose 40 mg) for 2 doses, then 0.8 mg/kg every 2 weeks (max. per dose 40 mg), review treatment if no response within 16 weeks; for further information on dose banding, consult product literature
Active polyarticular juvenile idiopathic arthritis (in combination with methotrexate alone if methotrexate inappropriate) in children who have not responded adequately to one or more disease-modifying antirheumatic drug
▶ BY SUBCUTANEOUS INJECTION
  ▶ Child 2–3 years: 24 mg/m² every 2 weeks (max. per dose 20 mg), review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
  ▶ Child 4–12 years: 24 mg/m² every 2 weeks (max. per dose 40 mg), review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
  ▶ Child 13–17 years: 40 mg every 2 weeks, review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
Active enthesitis-related arthritis in children who have had an inadequate response to, or who are intolerant of, conventional therapy
▶ BY SUBCUTANEOUS INJECTION
  ▶ Child 6–17 years: 24 mg/m² every 2 weeks (max. per dose 40 mg), for further information on dose banding, consult product literature
Severe active Crohn’s disease
▶ BY SUBCUTANEOUS INJECTION
  ▶ Child 6–17 years (body-weight up to 40 kg): Initially 40 mg, then 20 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once weekly, review treatment if no response within 12 weeks of initial dose
  ▶ Child 6–17 years (body-weight 40 kg and above): Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose
Severe active Crohn’s disease (accelerated regimen)
▶ BY SUBCUTANEOUS INJECTION
  ▶ Child 6–17 years (body-weight up to 40 kg): Initially 80 mg, then 40 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once weekly
weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

- Child 6-17 years (body-weight 40 kg and above): Initially 160 mg; dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose.

Active moderate to severe hidradenitis suppurativa (acne inversa) in patients with an inadequate response to conventional systemic therapy

- BY SUBCUTANEOUS INJECTION

- Child 12-17 years (body-weight 30 kg and above): Initially 80 mg, given as two 40 mg injections in one day, followed by 40 mg after 1 week, then maintenance 40 mg every 2 weeks; increased if necessary to 40 mg once weekly, review treatment if no response within 12 weeks; if treatment interrupted—consult product literature

- CONTRA-INDICATIONS Moderate or severe heart failure - severe infection

- CAUTIONS Children should be brought up to date with current immunisation schedule before initiating therapy - demyelinating disorders (risk of exacerbation) - development of malignancy - do not initiate until active infections are controlled (discontinue if new serious infection develops) - hepatitis B virus - monitor for active infection - history of malignancy - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection

- CAUTIONS, FURTHER INFORMATION

- Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.

- INTERACTIONS → Appendix 1: monoclonal antibodies

- SIDE-EFFECTS

- Rare Autoimmune hepatitis - demyelinating disorders - myocardial infarction

- SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

- PREGNANCY Avoid.

- BREAST FEEDING Avoid; manufacturer advises avoid for at least 5 months after last dose.

- PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

- MONITORING REQUIREMENTS

Manufacturer advises monitor for infection before, during, and for 4 months after treatment.

Manufacturer advises monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.

For uveitis, manufacturer advises patients should be assessed for pre-existing or developing central demyelinating disorders before and at regular intervals during treatment.

- PATIENT AND CARER ADVICE

An alert card should be provided.

When used to treat hidradenitis suppurativa, patients and their carers should be advised to use a daily topical antiseptic wash on lesions during treatment with adalimumab.

Tuberculosis patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, or, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Adalimumab is recommended as an option for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 2 years and older whose disease has responded inadequately to 1 or more disease-modifying antirheumatic drugs (DMARDs) and for treating enthesitis-related JIA in patients 6 years and older whose disease has responded inadequately to, or who are intolerant of, conventional therapy.

www.nice.org.uk/TA373

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (April 2015) that adalimumab (Humira®) is accepted for restricted use within NHS Scotland for the treatment of active enthesitis-related arthritis in children over 6 years of age who have had an inadequate response to, or who are intolerant of, conventional therapy, and is used within specialist rheumatology services (including those working within the network for paediatric rheumatology).

The Scottish Medicines Consortium has advised (June 2015) that adalimumab (Humira®) is accepted for restricted use within NHS Scotland for the treatment of severe chronic plaque psoriasis in children over 4 years who have had an inadequate response to, or are
inappropriate for, topical therapy and phototherapies, and have severe disease as defined by a total Psoriasis Area Severity Index (PASI) score of ≥10 and a Dermatology Life Quality Index (DLQI) of >10.

All Wales Medicines Strategy Group (AWMSG) Decisions
The All Wales Medicines Strategy Group has advised (January 2017) that adalimumab (Humira®) is recommended as an option for use within NHS Wales for the treatment of moderately to severely active Crohn’s disease in children 6 years and over, who have had an inadequate response to conventional therapy including primary nutrition therapy and a corticosteroid and/or an immunomodulator, or who are intolerant to or have contra-indications for such therapies.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

- Solution for injection
  Humira (AbbVie Ltd)

  Adalimumab 50 mg per 1 ml
  Humira 40mg/0.8ml solution for injection pre-filled syringes | 2 pre-filled disposable injection (PFS) £704.28
  Humira 40mg/0.8ml solution for injection pre-filled pen | 2 pre-filled disposable injection (PFS) £704.28
  Humira 40mg/0.8ml solution for injection vials | 2 vial (PFS) £704.28
  Adalimumab 100 mg per 1 ml
  Humira 40mg/0.4ml solution for injection pre-filled pen | 2 pre-filled disposable injection (PFS) £704.28
  Humira 40mg/0.4ml solution for injection pre-filled syringes | 2 pre-filled disposable injection (PFS) £704.28

- ENBREL® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION
  Polyarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it | Extended oligoarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it
  ▶ BY SUBCUTANEOUS INJECTION
  ▶ Child 2–17 years: 400 micrograms/kg twice weekly (max. per dose 25 mg), to be given at an interval of 3–4 days between doses, alternatively 800 micrograms/kg once weekly (max. per dose 50 mg), consider discontinuation if no response after 4 months

- Psoriatic arthritis in adolescents who have had an inadequate response to methotrexate or who cannot tolerate it | Enthesitis-related arthritis in adolescents who have had an inadequate response to conventional therapy or who cannot tolerate it
  ▶ BY SUBCUTANEOUS INJECTION
  ▶ Child 12–17 years: 800 micrograms/kg once weekly (max. per dose 50 mg), to be given at an interval of 3–4 days between doses, alternatively 800 micrograms/kg once weekly (max. per dose 50 mg), consider discontinuation if no response after 4 months

- Civil, severe plaque psoriasis in children who have had an inadequate response to other systemic therapies or phototherapies or who cannot tolerate them
  ▶ BY SUBCUTANEOUS INJECTION
  ▶ Child 6–17 years: 800 micrograms/kg once weekly (max. per dose 50 mg) for up to 24 weeks, discontinue if no response after 12 weeks

- Contra-indications
  Active infection • avoid injections containing benzyl alcohol in neonates

- Caution
  Children should be brought up to date with current immunisation schedule before initiating therapy • development of malignancy • diabetes mellitus • heart failure (risk of exacerbation) • hepatitis B virus—monitor for active infection • hepatitis C infection (monitor for worsening infection) • history of blood disorders • history of malignancy • history or increased risk of demyelinating

10 Musculoskeletal system
disorders, predisposition to infection (avoid if predisposition to septicemia), significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin.

CAUTIONS, FURTHER INFORMATION

- Tuberculosis: Active tuberculosis should be treated with standard treatment for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept.

- INTERACTIONS
  - Appendix 1: etanercept.

- SIDE-EFFECTS
  - Uncommon: Interstitial lung disease, new onset or worsening psoriasis, rash, skin cancer, uveitis.
  - Rare: Demyelinating disorders, lymphoma, seizures, Stevens–Johnson syndrome, vasculitis.
  - Very rare: Toxic epidermal necrolysis.

- Frequency not known: Abdominal pain, anaemia, antibody formation, aplastic anaemia, appendicitis, blood disorders, cutaneous ulcer, depression, diabetes mellitus, fever, gastritis, headache, hypersensitivity reactions, inflammatory bowel disease, injection-site reactions, leucopenia, leukoerythroblastic-like syndrome, macrophage activation syndrome, malignancy, nausea, oesophagitis, pancytopenia, pruritus, solid tumours, thrombocytopenia, vomiting, worsening heart failure.

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

- CONCEPTION AND CONTRACEPTION
  - Manufacturer advises effective contraception required during treatment and for 3 weeks after last dose.

- PREGNANCY
  - Avoid—limited information available.

- BREAST FEEDING
  - Manufacturer advises avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT
  - Use with caution in moderate to severe alcoholic hepatitis.

- PRE-TREATMENT SCREENING
  - Tuberculosis: Patients should be evaluated for tuberculosis before treatment.

- MONITORING REQUIREMENTS
  - Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).

- PRESCRIBING AND DISPENSING INFORMATION
  - Etanercept is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see Biological medicines and Biosimilar medicines, under Guidance on prescribing p. 1.

BENEPALI® SOLUTION FOR INJECTION

Manufacturer advises patients requiring less than the full 50 mg dose should not receive Benepali®—if an alternate dose is required, other etanercept formulations providing this option should be used.

- PATIENT AND CARER ADVICE
  - An alert card should be provided.
  - Blood disorders: Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.
  - Tuberculosis: Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Etanercept is recommended as an option for treatment:

- polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA, in patients 2 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate;
- enthesitis-related JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate.

www.nice.org.uk/TA373

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium (SMC) issued similar advice to NICE TA103 on the use of etanercept for severe plaque psoriasis in adults (August 2009) and children over 6 years old (April 2012).

The Scottish Medicines Consortium has advised (January 2013) that etanercept (Enbrel®) is accepted for restricted use within NHS Scotland for the treatment of polyarthritis (rheumatoid factor positive or negative) and extended oligoarthritis in children and adolescents from the age of 2 years who have had an inadequate response to or are intolerant of methotrexate, psoriatic arthritis in adolescents from the age of 12 years who have had an adequate response to or are intolerant of methotrexate, and enthesitis-related arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of conventional therapy. It is further restricted to use within specialist rheumatology services (including those working within the network for paediatric rheumatology).

2 Neuromuscular disorders

Neuromuscular disorders

Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in ocular myasthenia gravis and as an adjunct to immunosuppressant therapy for generalised myasthenia gravis.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 495 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thyreotomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in myasthenia gravis. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may impair neuromuscular transmission and precipitate myasthenia gravis. Excessive dosage of these drugs can

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastrointestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 779.

Neostigmine p. 619 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propaheline bromide p. 61 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. In infants, neostigmine by either subcutaneous or intramuscular injection is preferred for the short-term management of myasthenia.

Pyridostigmine bromide p. 620 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required. It is inadvisable to use excessive doses because acetylcholine receptor down regulation may occur. Immunosuppressant therapy may be considered if high doses of pyridostigmine bromide are needed.

Neostigmine and pyridostigmine bromide should be given to neonates 30 minutes before feeds to improve suckling.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

Immunosuppressant therapy

A course of corticosteroids is an established treatment in severe cases of myasthenia gravis and may be particularly useful when antibodies to the acetylcholine receptor are present in high titre. Short courses of high-dose (‘pulsed’) methylprednisolone p. 421 followed by maintenance therapy with oral corticosteroids may also be useful.

Corticosteroid treatment is usually initiated under specialist supervision. Transient but very serious worsening of symptoms can occur in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Once remission has occurred (usually after 2–6 months), the dose of prednisolone p. 421 should be reduced slowly to the minimum effective dose.

Skeletal muscle relaxants

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with neurological damage; they are not indicated for spasm associated with minor injuries. They act principally on the central nervous system with the exception of dantrolene, which has a peripheral site of action. They differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Dantrolene sodium p. 791 acts directly on skeletal muscle and produces fewer central adverse effects. It is generally used in resistant cases. The dose should be increased slowly. Baclofen p. 620 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

Diazepam p. 212 has undoubted efficacy in some children. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties.

2.1 Muscular dystrophy

DRUGS FOR NEUROMUSCULAR DISORDERS

Ataluren

24-May-2017

- **DRUG ACTION** Ataluren restores the synthesis of dystrophin by allowing ribosomes to read through premature stop codons that cause incomplete dystrophin synthesis in nonsense mutation Duchenne muscular dystrophy.

- **INDICATIONS AND DOSE**
  - Duchenne muscular dystrophy resulting from a nonsense mutation in the dystrophin gene, in ambulatory patients (initiated by a specialist)
    - **BY MOUTH**
      - Child 5–17 years: (consult product literature)

- **INTERACTIONS** → Appendix 1: ataluren

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal discomfort - constipation - cough - decreased appetite - diarrhoea - enuresis - epistaxis - flatulence - haematuria - headache - hypertension - hypertriglyceridaemia - musculoskeletal chest pain - nausea - pain in extremity - pyrexia - rash - upper abdominal pain - vomiting - weight loss
  - **Frequency not known** Changes in renal function tests - raised cholesterol

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.

- **RENAI IMPAIRMENT** Manufacturer advises close monitoring—safety and efficacy not established.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function at least every 6–12 months, and
2.2 Myasthenia gravis

**ANTICHOLINESTERASES**

### Anticholinesterases

**DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.

**CONTRA-INDICATIONS** Intestinal obstruction · urinary obstruction

**CAUTIONS** Arrhythmias · asthma (extreme caution) · atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection) but not given routinely because it may mask signs of overdosage · bradycardia · epilepsy · hyperthyroidism · hypotension · parkinsonism · peptic ulceration · recent myocardial infarction · vagotonia

**SIDE-EFFECTS** Abdominal cramps (more marked with higher doses) · diarrhoea · increased salivation · nausea · vomiting

**Overdose** Signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Amount probably too small to be harmful.

**INDICATIONS AND DOSE**

**Treatment of myasthenia gravis**

**BY MOUTH**

- **Neonate**: Initially 1–2 mg, then 1–5 mg every 4 hours, given 30 minutes before feeds.
- **Child 1 month–5 years**: Initially 7.5 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg
- **Child 6–11 years**: Initially 15 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg
- **Child 12–17 years**: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily

**BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**

- **Neonate**: 150 micrograms/kg every 6–8 hours, to be given 30 minutes before feeds, then increased if necessary up to 300 micrograms/kg every 4 hours.
- **Child 1 month–11 years**: 200–500 micrograms, dose repeated at suitable intervals throughout the day
- **Child 12–17 years**: 1–2.5 mg, dose repeated at suitable intervals throughout the day

**Reversal of non-depolarising (competitive) neuromuscular blockade**

**BY INTRAVENOUS INJECTION**

- **Neonate**: 50 micrograms/kg, to be given over 1 minute after or with glycopyrronium or atropine, followed by 25 micrograms/kg if required.
- **Child 1 month–11 years**: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg if required
- **Child 12–17 years**: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg (max. per dose 2.5 mg if required

**UNLICENSED USE**

- In neonates · Dose for treatment of myasthenia gravis by subcutaneous or intramuscular injection is unlicensed.

**CAUTIONS**

- With intravenous use · Glycopyrronium or atropine should also be given when reversing neuromuscular blockade

**INTERACTIONS** → Appendix 1: neostigmine

**RENAL IMPAIRMENT** May need dose reduction.

**DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

2.3 Spasticity

**MUSCLE RELAXANTS** > CENTRALLY ACTING

Baclofen

**INDICATIONS AND DOSE**

- **Chronic severe spasticity of voluntary muscle**
  - **BY MOUTH**
    - Child 1 month–7 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 40 mg per day
    - Child 8–17 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 60 mg per day

- **Severe chronic spasticity of cerebral or spinal origin unresponsive to oral antispastic drugs (or oral therapy not tolerated) (specialist use only)**
  - **BY INTRATHECAL INJECTION**
    - Child 4–17 years: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not more often than every 24 hours to determine initial maintenance dose; maintenance 25–200 micrograms daily, adjusted according to response, dose–titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose retaining some spasticity to avoid sensation of paralysis

**IMPORTANT SAFETY INFORMATION**
Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

- **CONTRA-INDICATIONS**
  - With intrathecal use Local infection · systemic infection
  - With oral use Avoid oral route in active peptic ulceration

- **CAUTIONS**

**GENERAL CAUTIONS**
Diabetes · epilepsy · history of peptic ulcer · hypertonic bladder sphincter · psychiatric illness · respiratory impairment

**SPECIFIC CAUTIONS**
- With intrathecal use Coagulation disorders · malnutrition (increased risk of post-surgical complications) · previous spinal fusion procedure

**INTERACTIONS** → Appendix 1: baclofen

**SIDE-EFFECTS**

- **Common or very common** Agitation · anxiety · ataxia · cardiovascular depression · confusion · depression · dizziness · drowsiness · dry mouth · euphoria · gastrointestinal disturbances · hallucinations · headache · hyperhidrosis · hypotension · insomnia · myalgia · nightmares · rash · respiratory depression · sedation · seizure · tremor · urinary disturbances · visual disturbances

- **Very rare** Hypothermia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies).

- **BREAST FEEDING** Present in milk—amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - With oral use Manufacturer advises use with caution.

- **RENAI IMPAIRMENT**
  - With oral use Risk of toxicity—use smaller oral doses and if necessary increase dosage interval; if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² use by mouth only if potential benefit outweighs risk. Excreted by the kidney.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.
Pain and inflammation in musculoskeletal disorders

3 Pain and inflammation in musculoskeletal disorders

Non-steroidal anti-inflammatory drugs

Therapeutic effects

In single doses non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol but paracetamol is preferred.

In regular full dosage NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation.

Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance of these drugs. A large proportion of children will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. However, in juvenile idiopathic arthritis NSAIDs may take 4–12 weeks to be effective. If appropriate responses are not obtained within these times, another NSAID should be tried. The availability of appropriate formulations needs to be considered when prescribing NSAIDs for children.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. However, in children gastro-intestinal symptoms are rare in those taking NSAIDs for short periods. The role of selective inhibitors of cyclo-oxygenase-2 is undetermined in children.

Ibuprofen p. 625 and naproxen p. 631 are propionic acid derivatives used in children.

Ibuprofen combines anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other NSAIDs but its anti-inflammatory properties are weaker.

Naproxen combines good efficacy with a low incidence of side-effects.

Diclofenac sodium p. 623, diclofenac potassium p. 622, indometacin p. 628, mefenamic acid p. 629, and piroxicam p. 632 have properties similar to those of propionic acid derivatives:

Diclofenac sodium and diclofenac potassium are similar in efficacy to naproxen.

Indometacin has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastrointestinal disturbances. It is rarely used in children and should be reserved for when other NSAIDs have been unsuccessful.

Mefenamic acid has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastrointestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Meloxicam p. 630 is a selective inhibitor of cyclo-oxygenase-2. Its use may be considered in adolescents intolerant to other NSAIDs.

Ketorolac trometamol p. 787 can be used for the short-term management of postoperative pain.

Etoricoxib p. 624, a selective inhibitor of cyclo-oxygenase-2, is licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, and acute gout in children aged 16 years and over.

Dental and orofacial pain

Most mild to moderate dental pain and inflammation is effectively relieved by ibuprofen, diclofenac potassium or diclofenac sodium.

NSAIDs and cardiovascular events

The risk of cardiovascular events secondary to NSAID use is undetermined in children. In adults, all NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those patients receiving high doses long term. A small increased thrombotic risk cannot be excluded in children.

In adults, cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are
associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of etoricoxib. Naproxen (in adults, 1 g daily) is associated with a lower thrombotic risk, and lower doses of ibuprofen (in adults, 1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms, and the need for long-term treatment should be reviewed periodically.

**NSAIDs and gastro-intestinal events**

All NSAIDs are associated with gastro-intestinal toxicity. In adults, evidence on the relative safety of NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam and ketorolac trometamol are associated with the highest risk; indomethacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Children appear to tolerate NSAIDs better than adults and gastro-intestinal side-effects are less common although they do still occur and can be significant; use of gastro-protective drugs may be necessary.

**Asthma**

All NSAIDs have the potential to worsen asthma, either acutely or as a gradual worsening of symptoms; consider both prescribed NSAIDs and those that are purchased over the counter.

**ANALGESICS › NON-Steroidal Anti-INFLAMMATORY Drugs**

**Diclofenac potassium**

- **INDICATIONS AND DOSE**
  - **Pain and inflammation in rheumatic disease and other musculoskeletal disorders**
    - **BY MOUTH**
      - Child 14–17 years: 75–100 mg daily in 2–3 divided doses
      - Postoperative pain
        - **BY MOUTH**
          - Child 9–13 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day
          - Child 14–17 years: 75–100 mg daily in 2–3 divided doses
      - Fever in ear, nose, or throat infection
        - **BY MOUTH**
          - Child 9–17 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

- **UNLICENSED USE** Voltarol® Rapid not licensed for use in children under 14 years or in fever.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease

- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS**
  - **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
  - **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero) and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Amount in milk too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **Voltarol Rapid** (Novartis Pharmaceuticals UK Ltd)
  - **Diclofenac potassium 50 mg** Voltarol Rapid 50mg tablets | 30 tablet [Pom] £7.94 DT price = £7.94
Diclofenac sodium

**INDICATIONS AND DOSE**

**Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 6 months-17 years: 1.5–2.5 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses; maximum 150 mg per day

**Postoperative pain**
- **BY RECTUM**
  - Child 6 months-17 years (body-weight 8-11 kg): 12.5 mg twice daily for maximum 4 days
  - Child 6 months-17 years (body-weight 12 kg and above): 1 mg/kg 3 times a day (max. per dose 50 mg) for maximum 4 days

**Inflammation | Mild to moderate pain**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY RECTUM**
  - Child 6 months-17 years: 0.3–1 mg/kg 3 times a day (max. per dose 50 mg)

**DICLOMAX RETARD®**

**Pain and inflammation**
- **BY MOUTH**
  - Child 12-17 years: 1 capsule once daily

**DICLOMAX SR®**

**Pain and inflammation**
- **BY MOUTH**
  - Child 12-17 years: 1 capsule 1–2 times a day

**MOTIFENE®**

**Pain and inflammation**
- **BY MOUTH**
  - Child 12-17 years: 1 capsule 1–2 times a day

**VOLTAROL® 75MG SR TABLETS**

**Pain and inflammation**
- **BY MOUTH**
  - Child 12-17 years: 1 tablet 1–2 times a day

**VOLTAROL® RETARD**

**Pain and inflammation**
- **BY MOUTH**
  - Child 12-17 years: 1 tablet once daily

**VOLTAROL® SOLUTION FOR INJECTION**

**Postoperative pain**
- **BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION**
  - Child 2-17 years: 0.3–1 mg/kg 1–2 times a day for maximum 2 days, for intramuscular injection, to be injected into the gluteal muscle; maximum 150 mg per day

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - avoid injections containing benzyl alcohol in neonates - avoid suppositories in proctitis - cerebrovascular disease - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - ischaemic heart disease - mild to severe heart failure - peripheral arterial disease

- With intravenous use  Dehydration · history of asthma · history of confirmed or suspected cerebrovascular bleeding · history of haemorrhagic diathesis · hypovolaemia · operations with high risk of haemorrhage

**CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS**
- Rare  Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

- Frequency not known  Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

- With intramuscular use or intravenous use  Injection site reactions

- With rectal use  Suppositories may cause rectal irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Serious side-effects  For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**PREGNANCY**  Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**  Use with caution during breast-feeding. Amount in milk too small to be harmful.

**HEPATIC IMPAIRMENT**  Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**  The lowest effective dose should be used for the shortest possible duration. Avoid in severe impairment. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- With intravenous use  Contra-indicated in moderate or severe renal impairment.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion, dilute 75 mg with 100–500 mL Glucose 5% or Sodium Chloride 0.9% (previously buffered with 0.5 mL Sodium Bicarbonate 8.4% solution or with 1 mL Sodium Bicarbonate 4.2% solution); give over 30–120 minutes.

Etoricoxib

INDICATIONS AND DOSE
Pain and inflammation in osteoarthritis

- BY MOUTH
  - Child 16-17 years: 30 mg once daily, increased if necessary to 60 mg once daily

CONTRA-INDICATIONS
Active gastro-intestinal bleeding - active gastro-intestinal ulceration - cerebrovascular disease - inflammatory bowel disease - ischaemic heart disease - mild to severe heart failure - peripheral arterial disease - uncontrolled hypertension (persistently above 140/90 mmHg)

CAUTIONS
Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - coagulation defects - connective-tissue disorders - Crohn's disease (may be exacerbated) - dehydration - history of cardiac failure - hypertension - left ventricular dysfunction - oedema - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated)

INTERACTIONS ➔ Appendix 1: NSAIDs

SIDE-EFFECTS

Common or very common
- Ecchymosis - fatigue - influenza-like symptoms - palpitation
- Uncommon
- Anxiety - appetite change - arthralgia - atrial fibrillation - chest pain - cough - dry mouth - dysphonia - electrolyte disturbance - epistaxis - flushing - mental acuity impaired - mouth ulcer - myalgia - paraesthesia - taste disturbance - transient ischaemic attack - weight change
- Rare
- Alveolitis - asptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
- Very rare
- Confusion - hallucinations
- Frequency not known
- Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn's disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rash - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects
- For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

CONCEPTION AND CONTRACEPTION
- Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

PREGNANCY
- Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
Flurbiprofen

**INDICATIONS AND DOSE**

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders** | **Migraine** | **Postoperative analgesia** | **Mild to moderate pain**
---|---|---|---
Child 12-17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

**Dysmenorrhoea**

**BY MOUTH**

Child 12-17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

**CONTRA-INDICATIONS**

Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure

**CAUTIONS**

Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

**INTERACTIONS** → Appendix 1: NSAIDs

**SIDE-EFFECTS**

- Common or very common: Stomatitis
- Uncommon: Confusion • fatigue • hallucinations • paraesthesia
- Rare: Alveolitis • aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances

- **Frequency not known**: Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • Crohn’s disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**PREGNANCY**

Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**

Use with caution during breast-feeding. Small amount present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**

The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution.

Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**RENAL IMPAIRMENT**

The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution.

Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

    - Fluribuprofen 100mg tablets | 100 tablet [Pom] £64.34 DT price = £64.33

**IBUPROFEN**

**INDICATIONS AND DOSE**

**Closure of ductus arteriosus**

**BY SLOW INTRAVENOUS INJECTION**

Neonate: Initially 10 mg/kg for 1 dose, followed by 5 mg/kg every 24 hours for 2 doses, the course may be repeated after 48 hours if necessary.

continued
Mild to moderate pain | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 1-2 months: 5 mg/kg 3–4 times a day
  - Child 3–5 months: 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - Child 6–11 months: 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - Child 1–3 years: 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - Child 4–6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
  - Child 7–9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
  - Child 10–11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
  - Child 12–17 years: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

**Pain and inflammation**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12–17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

**Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 3 months–17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

**Pain and inflammation in systemic juvenile idiopathic arthritis**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 3 months–17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

**Post-immunisation pyrexia in infants (on doctor’s advice only)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 2–3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

**UNLICENSED USE**

- With intravenous use Orphan licence for the injection for closure of ductus arteriosus in premature neonates less than 34 weeks corrected gestational age.
- With oral use Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

**CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

- With intravenous use Active bleeding (especially intracranial or gastro-intestinal) - coagulation defects - known or suspected necrotising enterocolitis - life-threatening infection - marked unconjugated hyperbilirubinaemia - pulmonary hypertension - thrombocytopenia

**CAUTIONS** Cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- With intravenous use May mask symptoms of infection

**CAUTIONS, FURTHER INFORMATION**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12–17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

**SIDE-EFFECTS**

- **Common or very common**
  - With intravenous use Bronchopulmonary dysplasia - fluid retention - haematuria - hyponatraemia - intestinal perforation - intraventricular haemorrhage - ischaemic brain injury - neutropenia - oedema - peripheral vascular disease - pulmonary haemorrhage - thrombocytopenia
  - **Rare**
    - With intravenous use Gastrointestinal haemorrhage
    - Alveolitis - asceptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances
    - **Frequency not known**

- With intravenous use Hypoxaemia

**SIDE-EFFECTS, FURTHER INFORMATION**

- **SERIOUS SIDE-EFFECTS** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

**OVERDOSE**

Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated p. 810 followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour. For details on the management of poisoning, see Emergency treatment of poisoning p. 803.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.
Hepatic impairment

- With intravenous use: increased risk of gastrointestinal bleeding and fluid retention. Avoid in severe liver disease.
- With oral use: use with caution; there is an increased risk of gastrointestinal bleeding and fluid retention. Avoid in severe liver disease.

Renal impairment

- Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- With intravenous use: use lowest effective dose. Avoid if possible in severe impairment.
- With oral use: the lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment.

Monitoring requirements

- With intravenous use: monitor for bleeding. Monitor gastrointestinal function.

Directions for administration

- For slow intravenous injection, give over 15 minutes, preferably undiluted. May be diluted with glucose 5% or sodium chloride 0.9%.

Prescribing and dispensing information

Flavours of syrup may include orange.

Patient and carer advice

Medicines for children leaflet: ibuprofen for pain and inflammation www.medicinesforchildren.org.uk/ibuprofen-for-pain-and-inflammation

Profession specific information

Dental practitioners’ formulary
ibuprofen oral suspension sugar-free may be prescribed. Ibuprofen tablets may be prescribed.

Exceptions to legal category

Oral preparations can be prescribed. With caution. Avoid in severe impairment.

Medicinal forms

There may be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include:
- Oral suspension

Effervescent granules

CAUTIONARY AND ADVISORY LABELS 13, 21

- Brands may include Nurofen Mellets
**Indomethacin**
(Indomethacin)

### INDICATIONS AND DOSE

**Symptomatic ductus arteriosus**

- **By intravenous infusion**
  - Neonate: Initially 100–200 micrograms/kg for 1 dose, followed by 100 micrograms/kg after 24 hours for 2 doses, at 24-hour intervals, doses to be given over 20–30 minutes, if residual patency present, 100 micrograms/kg to be given for a further 3 doses at 24-hour intervals.

**Relief of pain and inflammation in rheumatic diseases including juvenile idiopathic arthritis**

- **By mouth using immediate-release medicines**
  - Child: 0.5–1 mg/kg twice daily, higher doses may be used under specialist supervision.

### UNLICENSED USE
- With oral use Not licensed for use in children.

### CONTRA-INDICATIONS
- With intravenous use Bleeding (especially with active intracranial haemorrhage or gastro-intestinal bleeding), coagulation defects - necrotising enterocolitis, thrombocytopenia, untreated infection.
- With oral use Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure.

### CAUTIONS

#### GENERAL CAUTIONS
Heart failure

#### SPECIFIC CAUTIONS
- With intravenous use Inhibition of platelet aggregation (monitor for bleeding) - may induce hyponatraemia - may mask symptoms of infection - may reduce urine output by 50% or more and precipitate renal impairment especially if extracellular volume depleted - sepsis.
- With oral use Allergic disorders, cardiac impairment (NSAIDs may impair renal function), cerebrovascular disease, coagulation defects, connective-tissue disorders, Crohn’s disease (may be exacerbated), epilepsy, ischaemic heart disease, peripheral arterial disease, psychiatric disturbances, risk factors for cardiovascular events, ulcerative colitis (may be exacerbated), uncontrolled hypertension.

### INTERACTIONS
- Appendix 1: NSAIDs

### SIDE-EFFECTS

#### Rare
- With oral use Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - blood disorders - confusion - convulsions - hepatic damage - hyperglycaemia - interstitial fibrosis associated with NSAIDs can lead to renal failure - intestinal strictures - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - peripheral neuropathy - psychiatric disturbances - pulmonary eosinophilia - Stevens-Johnson syndrome - syncope - thrombocytopenia - toxic epidermal necrolysis - visual disturbances.

#### Frequency not known
- With intravenous use Coagulation disorders, exacerbation of infection, fluid retention - gastro-intestinal disorders, haemorrhagic disorders, intracranial bleeding, metabolic disorders, pulmonary hypertension, renal disorders.
- With oral use Angioedema, blood disorders, bronchospasm, colitis (induction of or exacerbation of), Crohn’s disease (induction of or exacerbation of), depression, diarrhoea, dizziness, drowsiness, fluid retention (rarely precipitating congestive heart failure), gastro-intestinal bleeding, gastro-intestinal discomfort, gastro-intestinal disturbances, gastro-intestinal ulceration, haematuria, headache, hearing disturbances, hyperkalaemia, hypersensitivity reactions - insomnia - nausea - nervousness, photosensitivity, raised blood pressure, rashes - renal failure (especially in patients with pre-existing renal impairment), tinnitus, vertigo.

### SPECIFIC INTERACTIONS

- **INTERACTIONS**
  - **By intravenous infusion**
    - Neonate: Initially 100–200 micrograms/kg for 1 dose, followed by 100 micrograms/kg after 24 hours for 2 doses, at 24-hour intervals, doses to be given over 20–30 minutes, if residual patency present, 100 micrograms/kg to be given for a further 3 doses at 24-hour intervals.
  - **With oral use**
    - Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure.

### PRECAUTIONS

#### PATIENT AND CARER ADVICE

- **Driving and skilled tasks**
  - Dizziness may affect performance of skilled tasks (e.g. driving).

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Capsule

- **Indomethacin**
  - **Indomethacin (Non-proprietary)***
    - **Indomethacin 25 mg**
      - Indomethacin 25mg capsules | 28 capsule
    - **Indomethacin 50 mg**
      - Indomethacin 50mg capsules | 28 capsule
  - **CAUTIONARY AND ADVISORY LABELS 21**
    - **Sentinel Events**
      - **Indomethacin 25 mg**
        - **Indomethacin 25mg capsules**
          - £5.00 DT price = £1.22
      - **Indomethacin 50 mg**
        - **Indomethacin 50mg capsules**
          - £7.50 DT price = £1.36

**BNFC 2017–2018**

---

**628 Pain and inflammation in musculoskeletal disorders**

**Musculoskeletal system**

---

**INTERACTIONS**

**SIDE-EFFECTS, FURTHER INFORMATION**

- **SERIOUS SIDE-EFFECTS**
  - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY**
  - With oral use Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING**
  - With oral use Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.

- **HEPATIC IMPAIRMENT**
  - With intravenous use Increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe impairment.
  - With oral use or rectal use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT**
  - With intravenous use Use lowest effective dose. Avoid if possible in severe impairment. If anuria or marked oliguria (urinary output less than 0.6 mL/kg/hour), delay further doses until renal function returns to normal.
  - With oral use The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MONITORING REQUIREMENTS**
  - With oral use During prolonged therapy ophthalmic and blood examinations particularly advisable.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion, dilute each vial with 1–2 mL Sodium Chloride 0.9% or Water for Injections.

---

**INDICATIONS AND DOSE**

**Symptomatic ductus arteriosus**

- **By intravenous infusion**
  - Neonate: Initially 100–200 micrograms/kg for 1 dose, followed by 100 micrograms/kg after 24 hours for 2 doses, at 24-hour intervals, doses to be given over 20–30 minutes, if residual patency present, 100 micrograms/kg to be given for a further 3 doses at 24-hour intervals.

**Relief of pain and inflammation in rheumatic diseases including juvenile idiopathic arthritis**

- **By mouth using immediate-release medicines**
  - Child: 0.5–1 mg/kg twice daily, higher doses may be used under specialist supervision.

---

**SIDE-EFFECTS**

**INTERACTIONS**

- Appendix 1: NSAIDs
**Ketoprofen**

- **INDICATIONS AND DOSE**
  For use as a component of Ketoprofen with omeprazole, below
  - BY MOUTH
  - Child 15-17 years: (consult product literature)

- **CONTRA-INDICATIONS**
  - Active gastro-intestinal bleeding
  - active gastro-intestinal ulceration
  - history of gastro-intestinal bleeding
  - history of gastro-intestinal perforation
  - history of gastro-intestinal ulceration
  - severe heart failure

- **CAUTIONS**
  - Allergic disorders - cardiac impairment (NSAIDs may impair renal function)
  - cerebrovascular disease
  - coagulation defects - connective-tissue disorders - Crohn’s disease
  - (may be exacerbated) - heart failure - ischaemic heart disease
  - peripheral arterial disease - risk factors for cardiovascular events
  - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **SIDE-EFFECTS**
  - Rare
    - Alveolitis - asceptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible)
    - hepatic damage
    - interstitial fibrosis associated with NSAIDs can lead to renal failure
    - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure
    - pulmonary eosinophilia
    - Stevens-Johnson syndrome
    - toxic epidermal necrolysis - visual disturbances

  - Frequency not known
    - Angioedema - blood disorders
    - bronchospasm - colitis (induction of or exacerbation of)
    - Crohn’s disease (induction of or exacerbation of)
    - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure)
    - gastro-intestinal bleeding - gastro-intestinal discomfort
    - gastro-intestinal disturbances - gastro-intestinal ulceration
    - haematuria - headache - hearing disturbances
    - hypersensitivity reactions - insomnia - nausea
    - nervousness - photosensitivity - raised blood pressure - rashes
    - renal failure (especially in patients with pre-existing renal impairment)
    - tinnitus - vertigo

  - SIDE-EFFECTS, FURTHER INFORMATION
    - Serious side-effects
      - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

  - ALLERGY AND CROSS-SENSITIVITY
    - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAIDs—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

  - CONCEPTION AND CONCEPTION
    - Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

  - PREGNANCY
    - Avoid unless the potential benefit outweighs the risk.
    - Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

  - BREAST FEEDING
    - Use with caution during breast-feeding. Amount probably too small to be harmful but manufacturers advise avoid.

  - HEPATIC IMPAIRMENT
    - Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Should be avoided in severe liver disease.

  - RENAL IMPAIRMENT
    - The lowest effective dose should be used for the shortest possible duration.
    - Avoid if possible or use with caution. Avoid in severe impairment. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of oral liquid formulations may include strawberry.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Ketoprofen with omeprazole**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ketoprofen above, omeprazole p. 57.

- **INDICATIONS AND DOSE**
  - Patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID associated duodenal or gastric ulcer or gastroduodenal erosions
  - BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Child 15-17 years: Initially 100/20 mg daily, increased if necessary to 200/20 mg daily, depending on severity of symptoms, dose expressed as x/y mg ketoprofen/omeprazole.

- **INTERACTIONS**
  - Appendix 1: NSAIDs, proton pump inhibitors

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - No licensed medicines listed.

**Mefenamic acid**

- **INDICATIONS AND DOSE**
  - Acute pain including dysmenorrhoea
  - Menorrhagia
  - BY MOUTH
  - Child 12-17 years: 500 mg 3 times a day

- **CONTRA-INDICATIONS**
  - Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - inflammatory bowel disease - severe heart failure

- **CAUTIONS**
  - Acute porphyrias p. 577 - allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - epilepsy - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **INTERACTIONS**
  - Appendix 1: NSAIDs

- **SIDE-EFFECTS**
  - Common or very common
    - Diarrhoea (withdraw treatment)
    - rashes (withdraw treatment)
    - stomatitis
  - Uncommon
    - Fatigue - paraesthesia
  - Rare
    - Alveolitis - aplastic anaemia - asceptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible)
    - glucose intolerance
    - haemolytic anaemia
    - positive Coombs’ test
    - hepatic damage
    - hypotension

---

Pain and inflammation in musculoskeletal disorders 629

BNFC 2017–2018

Musculoskeletal system
interstitial fibrosis associated with NSAIDs can lead to renal failure • palpitation • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • thrombocytopenia • toxic epidermal necrolysis • visual disturbances

- Frequency not known Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of)
- Crohn’s disease (induction of or exacerbation of)
- depression • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

SIDE-EFFECTS, FURTHER INFORMATION
- Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.
- Overdose
  Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent, require treatment.
  For details on the management of poisoning, see Emergency treatment of poisoning p. 803, in particular, Convulsions.

ALLERGY AND CROSS-SENSITIVITY
- Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- PREGNANCY
  Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- BREAST FEEDING
  Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.
- HEPATIC IMPAIRMENT
  Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- RENAL IMPAIRMENT
  The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension
- CAUTIONARY AND ADVISORY LABELS 21
- Excipients: May contain Ethanol
  - Mefenamic acid (Non-proprietary)
    - Mefenamic acid 10 mg per 1 ml Mefenamic acid 50mg/5ml oral suspension | 125 ml (Pots) £179.00 DT price = £179.00
- Tablet
  - CAUTIONARY AND ADVISORY LABELS 21
  - Mefenamic acid (Non-proprietary)
    - Mefenamic acid 500 mg Mefenamic acid 500mg tablets | 28 tablet (Pot) £50.20 DT price = £6.15 | 84 tablet (Pot) £44.99

    - Ponstan (Chemidex Pharma Ltd)
      - Mefenamic acid 250 mg Ponstan 250mg capsules | 100 capsule (Pot) £81.17 DT price = £9.54

Meloxicam
- INDICATIONS AND DOSE
  - Exacerbation of osteoarthritis (short-term)
    - BY MOUTH
      - Child 16–17 years: 7.5 mg once daily, then increased if necessary up to 15 mg once daily
  - Pain and inflammation in rheumatic disease • Ankylosing spondylitis
    - BY MOUTH
      - Child 16–17 years: 15 mg once daily, then reduced to 7.5 mg once daily if required
  - Relief of pain and inflammation in juvenile idiopathic arthritis and other musculoskeletal disorders in children intolerant to other NSAIDs
    - BY MOUTH
      - Child 12–17 years (body-weight up to 50 kg): 7.5 mg once daily
      - Child 12–17 years (body-weight 50 kg and above): 15 mg once daily

- UNLICENSED USE
  - Not licensed for use in children under 16 years.

- CONTRA-INDICATIONS
  - Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • severe heart failure

- CAUTIONS
  - Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn’s disease (may be exacerbated) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

- INTERACTIONS
  - Appendix 1: NSAIDs

- SIDE-EFFECTS
  - Rare
    - Alveolitis • aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances

- Frequency not known
  - Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of)
  - Crohn’s disease (induction of or exacerbation of)
  - depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo
SERIOUS SIDE-EFFECTS

Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING Use with caution during breast-feeding. Present in milk in animal studies—manufacturer advises avoid.

HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution.

Avoid if estimated glomerular filtration rate less than 25 ml/minute/1.73 m². In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Oral suspension

Meloxicam (Non-proprietary)

Meloxicam 7.5 mg Meloxicam 7.5mg orodispersible tablets sugar free sugar-free | 30 tablet PoS £15.50

INDICATIONS AND DOSE

Pain and inflammation in musculoskeletal disorders | Dysmenorrhoea

BY MOUTH

Child: 5 mg/kg twice daily; maximum 1 g per day

Pain and inflammation in juvenile idiopathic arthritis

BY MOUTH

Child 2-17 years: 5–7.5 mg/kg twice daily; maximum 1 g per day

UNLICENSED USE Not licensed for use in children under 5 years for juvenile idiopathic arthritis. Not licensed for use in children under 16 years for musculoskeletal disorders or dysmenorrhoea.

CONTRA-INDICATIONS Active gastro-intestinal bleeding, active gastro-intestinal ulceration, history of gastro-intestinal bleeding related to previous NSAID therapy, history of gastro-intestinal perforation related to previous NSAID therapy, history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) history of recurrent gastro-intestinal ulceration (two or more distinct episodes) severe heart failure

Allergic disorders - cardiac impairment (NSAIDs may impair renal function) cerebrovascular disease, coagulation defects, connective tissue disorders, Crohn’s disease (may be exacerbated) heart failure ischaemic heart disease peripheral arterial disease risk factors for cardiovascular events ulcerative colitis (may be exacerbated) uncontrolled hypertension

INTERACTIONS Appendix 1: NSAIDs

SIDE-EFFECTS

Rare Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible); hepatic damage, interstitial fibrosis associated with NSAIDs can lead to renal failure, pancreatitis, papillary necrosis associated with NSAIDs can lead to renal failure, pulmonary eosinophilia Stevens-Johnson syndrome toxic epidermal necrolysis visual disturbances

FREQUENCY NOT KNOWN Angioedema, blood disorders, bronchospasm, colitis (induction of or exacerbation of), Crohn’s disease (induction of or exacerbation of), depression, diarrhoea, dizziness, drowsiness, fluid retention (rarely precipitating congestive heart failure), gastro-intestinal bleeding, gastro-intestinal discomfort, gastro-intestinal disturbances, gastro-intestinal ulceration, haematuria, headache, hearing disturbances, hypersensitivity reactions, insomnia, nausea, nervousness, photosensitivity, raised blood pressure, rashes, renal failure (especially in patients with pre-existing renal impairment), tinnitus, vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

ALLERGY AND CROSS-SENSITIVITY Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

PREGNANCY Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

BREAST FEEDING Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.

HEPATIC IMPAIRMENT Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

RENAL IMPAIRMENT The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution.

Avoid if estimated glomerular filtration rate less than 25 ml/minute/1.73 m². In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**Piroxicam**

- **INDICATIONS AND DOSE**
Relief of pain and inflammation in juvenile idiopathic arthritis
  - **BY MOUTH**
    - Child 6–17 years (body-weight up to 15 kg): 5 mg daily
    - Child 6–17 years (body-weight 15–25 kg): 10 mg daily
    - Child 6–17 years (body-weight 26–45 kg): 15 mg daily
    - Child 6–17 years (body-weight 46 kg and above): 20 mg daily

- **UNLICENSED USE**
  - Not licensed for use in children.

---

**IMPORTANT SAFETY INFORMATION**
The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:

- Piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- Piroxicam should not be used as first-line treatment
- In adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- Piroxicam dose should not exceed 20 mg daily
- Piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- Treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter
- Concomitant administration of a gastro-protective agent should be considered

Topical preparations containing piroxicam are not affected by these restrictions.

- **CONTRA-INDICATIONS**
  - Active gastro-intestinal bleeding · history of gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · inflammatory bowel disease · severe heart failure

- **CAUTIONS**
  - Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn’s disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

- **Frequency not known**
  - Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn’s disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Serious side-effects
    - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 621.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY**
  - Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING**
  - Use with caution during breast-feeding. Amount too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT**
  - The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **DIRECTIONS FOR ADMINISTRATION**
  - Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing. Piroxicam orodispersible tablets may be halved to give 10 mg dose.

- **LESS SUITABLE FOR PRESCRIBING**
  - Piroxicam is less suitable for prescribing.
Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, including juvenile idiopathic arthritis, they are given by intra-articular injection as monotherapy, or as an adjunct to long-term therapy to reduce swelling and deformity in one or a few joints. Aseptic precautions (e.g. a no-touch technique) are essential, as is a clinician skilled in the technique; infected areas should be avoided and general anaesthesia, or local anaesthesia, or conscious sedation should be used.

Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Triamcinolone hexacetonide p. 634 [unlicensed] is preferred for intra-articular injection because it is almost insoluble and has a long-acting (depot) effect. Triamcinolone acetonide p. 634 and methylprednisolone may also be considered for intra-articular injection into larger joints, whilst hydrocortisone below acetate should be reserved for smaller joints or for soft-tissue injections. Intra-articular corticosteroid injections can cause flushing and, in adults, may affect the hyaline cartilage. Each joint should usually be treated no more than 3–4 times in one year.

A smaller amount of corticosteroid may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer’s elbow or compression neuromas, which occur rarely in children. In tendinitis, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

### Hydrocortisone

**INDICATIONS AND DOSE**

**HYDROCORTISTAB®**

Local inflammation of joints and soft-tissues

- **By intra-articular injection**
  - Child 1 month–11 years: 5–30 mg, select dose according to size of child and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature
  - Child 12–17 years: 5–50 mg, select dose according to size of patient and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature

**INTERACTIONS** [Appendix 1: corticosteroids]

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **Hydrocortisone (AMCo)**
  - Hydrocortisone acetate 25 mg per 1 ml Hydrocortistab 25mg/1ml suspension for injection ampoules | 10 ampoule [PoM] £68.72 DT price = £68.72

### Methylprednisolone

**INDICATIONS AND DOSE**

**DEPO-MEDRONE®**

Local inflammation of joints and soft tissues

- **By intra-articular injection**
  - Child: (consult product literature)
Triamcinolone acetonide

**INDICATIONS AND DOSE**

**ADCORTYL® INTRA-ARTICULAR/INTRADERMAL**

**Local inflammation of joints and soft tissues**

- BY INTRA-ARTICULAR INJECTION
  - Child 1–17 years: 2 mg/kg (max. per dose 15 mg), for details consult product literature, dose applies for larger joints. For doses above 15 mg use Kenalog® Intra-articular/Intramuscular. If appropriate repeat treatment for relapse.

**KENALOG® VIALS**

**Local inflammation of joints and soft tissues**

- BY INTRA-ARTICULAR INJECTION
  - Child 1–17 years: 2 mg/kg, for details consult product literature, if appropriate repeat treatment for relapse, higher doses than usual maximum have been used; usual maximum 40 mg

**UNLICENSED USE**

Not licensed for use in children under 6 years.

**INTERACTIONS**

Appendix 1: corticosteroids

**PATIENT AND CARER ADVICE**

Patient counselling is advised for triamcinolone acetonide injection (steroid card).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**CAUTIONARY AND ADVISORY LABELS**

100 mg/ml solution for injection ampoule | 1 vial | £3.44 | 10 vial | £34.04

---

**4.2 Soft tissue disorders**

**Soft-tissue disorders**

**Soft-tissue and musculoskeletal disorders**

The management of children with soft-tissue injuries and strains, and musculoskeletal disorders, may include temporary rest together with the local application of heat or cold, local massage and physiotherapy. For pain relief, paracetamol p. 260 is often adequate and should be used first. Alternatively, the lowest effective dose of a NSAID (e.g. ibuprofen p. 625) can be used. If pain relief with either drug is inadequate, both paracetamol (in a full dose appropriate for the child) and a low dose of a NSAID may be required.

**Extravasation**

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with promptly to prevent tissue necrosis. Acidic or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. Very young children are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or analgesics may not notice the early signs or symptoms of extravasation.

**Prevention of extravasation**

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and children receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration. Placing a glyceryl trinitrate patch or using glyceryl trinitrate ointment distal to the cannula may improve the patency of the vessel in children with small veins or in those whose...
Veins are prone to collapse. Children or their carers should be asked to report any pain or burning at the site of injection immediately.

**Management of extravasation**

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

**Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 633 or dexamethasone p. 419 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. Antihistamines and analgesics may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase below. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should **not** be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique).

**Enzymes**

Hyaluronidase is used for the management of extravasation.

### Enzymes

**Hyaluronidase**

#### Indications and Dose

**Extravasation**

- **By local infiltration**
- **Child:** (consult product literature)

#### Unlicensed Use

Licensed for use in children, but age range not specified by the manufacturer.

#### Contraindications

Avoid sites where infection is present · avoid sites where malignancy is present · do not apply direct to cornea · not for anaesthesia in unexplained premature labour · not for intravenous administration · not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists · not to be used to reduce swelling of bites · not to be used to reduce swelling of stings

#### Cautions

Infants (control speed and total volume and avoid overhydration especially in renal impairment)

#### Side-effects

- **Common or very common** Oedema
- **Rare** Bleeding · bruising · infection · local irritation
- **Frequency not known** Anaphylaxis · severe allergy

#### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Hyaluronidase (Non-proprietary)**
  - Hyaluronidase 1500 unit
  - Hyaluronidase 1,500 unit powder for solution for injection ampoules | 10 ampoule (£136.55)

Eye

Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—contact individual manufacturers for further information. They are particularly useful for children in whom normal application is difficult, for the visually impaired, or otherwise physically limited patients.

Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; in neonates and infants it may be more appropriate to administer the drop in the inner angle of the open eye. One drop is all that is needed; instillation of more than one drop at a time should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow can occur when one immediately follows the other. The carer or child should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops. Both drops and ointment can cause transient blurred vision; children should be warned, where appropriate, not to perform skilled tasks (e.g. cycling or driving) until vision is clear.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

Also see warnings relating to eye drops and contact lenses.

Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% p. 645 solution is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Ophthalmic Specials

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. ‘Specials’ should only be prescribed in situations where a licensed product will not be suitable for a child’s needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk).

The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in hospital wards are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be
discarded at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In out-patient departments single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In eye surgery single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann’s solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

**Contact lenses**

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid (‘hard’ or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

*Acanthamoeba keratitis*, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

**Contact lenses and drug treatment**

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 120 and hydralazine hydrochloride p. 113). Other drugs that may affect contact lens wear are isotretinoin p. 727 (can cause conjunctival inflammation), aspirin p. 89 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 349 and sulfasalazine p. 30 (can discoulour lenses).

### 1 Allergic and inflammatory eye conditions

#### Eye, allergy and inflammation

**Corticosteroids**

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery. *Topical corticosteroids* should normally only be used under expert supervision; three main dangers are associated with their use:

- a ‘red eye’, when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye.
- Bacterial, fungal, and amoebic infections pose a similar hazard;
- ‘steroid glaucoma’ can follow the use of corticosteroid eye preparations in susceptible individuals;
- a ‘steroid cataract’ can follow prolonged use.

Products combining a corticosteroid with an antimicrobial are used after ocular surgery to reduce inflammation and prevent infection: use of combination products is otherwise rarely justified.

**Systemic corticosteroids** may be useful for ocular conditions. The risk of producing a ‘steroid cataract’ increases with the dose and duration of corticosteroid use.

**Other anti-inflammatory preparations**

Eye drops containing *antihistamines*, such as *antazoline* (with xylometazoline hydrochloride p. 637 as Otrivine-Antistin®), azelastine hydrochloride p. 638, epinastine hydrochloride p. 638, ketotifen p. 638, and olopatadine p. 638, can be used for allergic conjunctivitis.

Sodium cromoglicate p. 639 and nedocromil sodium p. 639 eye drops may be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops p. 639 are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Emedastine eye drops p. 638 are licensed for seasonal allergic conjunctivitis.

#### 1.1 Allergic conjunctivitis

**ANTIHISTAMINES**

### Antazoline with xylometazoline

**INDICATIONS AND DOSE**

**Allergic conjunctivitis**

- **TO THE EYE**
- **Child 12-17 years**: Apply 2–3 times a day for maximum 7 days

**CAUTIONS** Angle-closure glaucoma · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism · phaeochromocytoma · urinary retention

**INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
**SIDE-EFFECTS**
- **Common or very common** Transient stinging
- **Frequency not known** Blurred vision • eye irritation • mydriasis

**SIDE-EFFECTS, FURTHER INFORMATION**
Absorption of antazoline and xylometazoline may result in systemic side-effects.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
- **Epina**
  - Epinastine hydrochloride 500 microgram per 1 ml
  - Zaditen (Thea Pharmaceuticals Ltd) Ketotifen (as Ketotifen fumarate) 250 microgram per 1 ml
  - Relestat (Allergan Ltd) Epinastine hydrochloride 500 microgram per 1 ml
  - Relestat 500 micrograms/ml eye drops | 5 ml [PoSt] £9.90 DT price = £9.90

**Ketotifen**

**INDICATIONS AND DOSE**
**Seasonal allergic conjunctivitis**
- **TO THE EYE**
  - Child 3-17 years: Apply twice daily

**INTERACTIONS** → Appendix 1: antihistamines (sedating)

**SIDE-EFFECTS**
- **Common or very common** Puncture corneal epithelial erosion • transient burning • transient stinging
- **Uncommon** Dry eye • photophobia • subconjunctival haemorrhage
- **Frequency not known** Drowsiness • dry mouth • headache • skin reactions

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **EXCIPIENTS:** May contain Benzalkonium chloride
- **Zaditen** Ketotifen (as Ketotifen fumarate) 250 microgram per 1 ml
  - Zaditen 250 micrograms/ml eye drops | 5 ml [PoSt] £7.80 DT price = £7.80

**Olopatadine**

**INDICATIONS AND DOSE**
**Seasonal allergic conjunctivitis**
- **TO THE EYE**
  - Child 3-17 years: Apply twice daily for maximum 4 months

**SIDE-EFFECTS**
- **Common or very common** Local irritation
- **Uncommon** Asthenia • dizziness • dry eye • headache • keratitis • local oedema • photophobia
- **Frequency not known** Dry nose

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **EXCIPIENTS:** May contain Benzalkonium chloride
- **Opatanol** (Alcon Laboratories (UK) Ltd) Olopatadine (as Olopatadine hydrochloride) 1 mg per 1 ml
  - Opatanol 1 mg/ml eye drops | 5 ml [PoSt] £4.68 DT price = £4.68
MAST-CELL STABILISERS

Lodoxamide

- **INDICATIONS AND DOSE**
  - **Allergic conjunctivitis**
    - **TO THE EYE**
    - Child 4–17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks
  - **SIDE-EFFECTS**
    - **Common or very common** Blurred vision · burning · itching · ocular discomfort · stinging · tear production disturbance
    - **Uncommon** Blepharitis · dizziness · drowsiness · flushing · headache · keratitis · nasal dryness
  - **EXCEPTIONS TO LEGAL CATEGORY** Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in children over 4 years.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
      - *Alomide* (Alcon Laboratories (UK) Ltd)
        - Lodoxamide (as Lodoxamide trometamol) 1 mg per 1 ml
        - Alomide Allergy 0.1% eye drops | 10 ml (£0.55) £5.21 DT price = £5.21
        - Alomide Allergy 0.1% eye drops | 5 ml (£0.25) £3.12

Nedocromil sodium

- **INDICATIONS AND DOSE**
  - **Seasonal and perennial conjunctivitis**
    - **TO THE EYE**
    - Child 6–17 years: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis
  - **Seasonal keratoconjunctivitis**
    - **TO THE EYE**
    - Child 6–17 years: Apply 4 times a day
  - **SIDE-EFFECTS** Distinctive taste · transient burning · transient stinging

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
      - *Rapitil* (Sanofi)
        - Nedocromil sodium 20 mg per 1 ml
        - Rapitil 2% eye drops | 5 ml (£0.86) £2.86

Sodium cromoglicate (Sodium cromoglycate)

- **INDICATIONS AND DOSE**
  - **Allergic conjunctivitis · Seasonal keratoconjunctivitis**
    - **TO THE EYE**
    - Child: Apply 4 times a day

- **SIDE-EFFECTS** Transient burning · transient stinging

- **PREGNANCY** Not known to be harmful. Inhaled drugs can be taken as normal during pregnancy.

- **EXCEPTIONS TO LEGAL CATEGORY** Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 ml) for treatment of acute seasonal and perennial allergic conjunctivitis.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
    - **Eye drops**
      - *Sodium cromoglicate (Non-proprietary)*
        - Sodium cromoglicate 20 mg per 1 ml
        - Sodium cromoglicate 2% eye drops | 13.5 ml (£0.91) £8.03 DT price = £2.35
      - *Cromolux* (Tubilux Pharma Ltd)
        - Sodium cromoglicate 20 mg per 1 ml
        - Cromolux 2% eye drops | 13.5 ml (£0.91) £3.20 DT price = £2.35
      - *Opticrom* (Sanofi)
        - Sodium cromoglicate 20 mg per 1 ml
        - Opticrom Aqueous 2% eye drops | 13.5 ml (£0.91) £8.03 DT price = £2.35
      - *Vividrin* (Bausch & Lomb UK Ltd)
        - Sodium cromoglicate 20 mg per 1 ml
        - Vividrin 2% eye drops | 13.5 ml (£0.91) £10.95 DT price = £2.35

1.2 Inflammatory eye conditions

CORTICOSTEROIDS

Betamethasone

- **INDICATIONS AND DOSE**
  - **Local treatment of inflammation (short-term)**
    - **TO THE EYE USING EYE DROP**
      - Child: Apply every 1–2 hours until controlled then reduce frequency
      - **TO THE EYE USING EYE OINTMENT**
      - Child: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

- **INTERACTIONS** → Appendix 1: corticosteroids

- **SIDE-EFFECTS** Adrenal suppression following prolonged use in neonates · corneal thinning · scleral thinning

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye/l/ear/eye/nose drops solution**
    - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
      - *Betamethasone* (Non-proprietary)
        - Betamethasone sodium phosphate 1 mg per 1 mg
        - Betamethasone sodium phosphate 1 mg per 1 ml
        - Betamethasone sodium phosphate 1 mg per 1 fluid ounce
      - *Betnesol* (Focus Pharmaceuticals Ltd)
        - Betnesol sodium phosphate 1 mg per 1 ml
        - Betnesol 0.1% eye/ear/nose drops | 10 ml (£29.10) £23.22 DT price = £2.32
      - *Vistamethasone* (Martindale Pharmaceuticals Ltd)
        - Vistamethasone sodium phosphate 1 mg per 1 ml
        - Vistamethasone 0.1% eye/ear/nose drops | 5 ml (£0.87) £10.99 DT price = £2.32
      - **Eye ointment**
        - *Betnesol* (Focus Pharmaceuticals Ltd)
          - Betnesol sodium phosphate 1 mg per 1 gram
          - Betnesol 0.1% eye ointment | 3 gram (£0.1) £1.41 DT price = £1.41

    - **Combinations available:** *Betamethasone with neomycin*, p. 640

Dexamethasone

- **INDICATIONS AND DOSE**
  - **Local treatment of inflammation (short-term)**
    - **TO THE EYE USING EYE DROP**
      - Child: Apply every 4–6 times a day
      - **Short term local treatment of inflammation (severe conditions)**
      - **TO THE EYE USING EYE DROP**
      - Child: Apply 30–60 minutes until controlled, reduce frequency when control achieved
Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 639, neomycin sulfate p. 662.

**INDICATIONS AND DOSE**

Local treatment of eye inflammation and bacterial infection (short-term)

- TO THE EYE USING EYE DROP
- Child: (consult product literature)

**LESS SUITABLE FOR PRESCRIBING**

Betamethasone with neomycin eye-drops are less suitable for prescribing.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye/nose drops solution**

**INDICATIONS AND DOSE**

Local treatment of eye inflammation (short-term)

- TO THE EYE
- Child: Apply every 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

**Dexamethasone with framycetin sulfate and gramicidin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 639, framycetin sulfate p. 661.

**INDICATIONS AND DOSE**

Local treatment of inflammation (short-term)

- TO THE EYE
- Child: Apply every 1–2 hours until controlled then reduce frequency

**UNLICENSED USE**

Pred Forte® not licensed for use in children (age range not specified by manufacturer).
Dexamethasone with hyromellose, neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 639, neomycin sulfate p. 662.

**SIDE-EFFECTS**

1. **Antimuscarinics**

   **INDICATIONS AND DOSE**
   - **Local treatment of inflammation (short-term)**
     - **TO THE EYE USING EYE DROP**
     - **Child:** Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day
   - **Local treatment of inflammation (short-term)**
     - **TO THE EYE USING EYE OINTMENT**
     - **Child:** Apply 3–4 times a day, alternatively, apply at night when used with eye drops

**INTERACTIONS**

- **Atropine sulfate**
  - **INDICATIONS AND DOSE**
    - **Cycloplegia**
      - **TO THE EYE USING EYE DROP**
      - **Child 3 months–17 years:** Apply twice daily for 3 days, before procedure
      - **Anterior uveitis**
        - **TO THE EYE USING EYE DROP**
        - **Child 2–17 years:** Apply 1 drop up to 4 times a day

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye ointment**
    - EXCIPIENTS: May contain Hydroxybenzoates (parabens), wool fat and related substances including lanolin
  - **Eye drops**
    - EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

- **LESS SUITABLE FOR PRESCRIBING**
  - Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

- **PATIENT AND CARER ADVICE**
  - Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

**Atropine sulfate**

- **INDICATIONS AND DOSE**
  - **Cycloplegia**
    - **TO THE EYE USING EYE DROP**
    - **Child 3 months–17 years:** Apply twice daily for 3 days, before procedure
  - **Anterior uveitis**
    - **TO THE EYE USING EYE DROP**
    - **Child 2–17 years:** Apply 1 drop up to 4 times a day

- **UNLICENSED USE**
  - Not licensed for use in children for uveitis.

- **SIDE-EFFECTS**
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Toxic systemic reactions can occur. Systemic side-effects can occur.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Although multi-dose atropine sulphate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
  - **Eye drops**
    - **Atropine sulfate (Non-proprietary)**
      - **Antispasmodics**
        - **TO THE EYE**
        - **Child 3 months–11 years:** Apply 1 drop, 30–60 minutes before examination, using 1% eye drops
        - **Child 12–17 years:** Apply 1 drop, 30–60 minutes before examination, using 0.5% eye drops

**Cyclosporin hydrochloride**

- **INDICATIONS AND DOSE**

  - **Cycloplegia**
    - **TO THE EYE**
    - **Child 3 months–11 years:** Apply 1 drop, 30–60 minutes before examination, using 1% eye drops
    - **Child 12–17 years:** Apply 1 drop, 30–60 minutes before examination, using 0.5% eye drops

- **SIDE-EFFECTS**

  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Toxic systemic reactions can occur. Systemic side-effects can occur.

  - **PRESCRIBING AND DISPENSING INFORMATION**
    - Although multi-dose cyclosporin eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

1.2a Anterior uveitis

**ANTIMUSCARINICS (eye)**

- **CAUTIONS**
  - Children under 3 months owing to the possible association between cycloplegia and the development of amblyopia - darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · mydriasis can precipitate acute angle-closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber) · neonates at increased risk of systemic toxicity

- **SIDE-EFFECTS**
  - Conjunctivitis (on prolonged administration) · contact dermatitis · eye oedema (on prolonged administration) · hyperaemia (on prolonged administration) · local irritation (on prolonged administration) · raised intraocular pressure · transient stinging

- **PATIENT AND CARER ADVICE**
  - Patients may not be able to undertake skilled tasks until vision clears after mydriasis.
### Homatropine hydrobromide

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:** May contain benzalkonium chloride.

- Cyclopentolate hydrochloride (Bausch & Lomb UK Ltd)
- Mydriodate (Intrapharm Laboratories Ltd)
- Cyclopentolate hydrochloride 5 mg per 1 ml Minims cyclopentolate hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoS] £10.97 DT price = £10.97
- Cyclopentolate hydrochloride 10 mg per 1 ml Minims cyclopentolate hydrochloride 1% eye drops 0.5ml unit dose | 20 unit dose [PoS] £11.23 DT price = £11.23

**INDICATIONS AND DOSE**

**Anterior uveitis**

- TO THE EYE
  - Child 3 months-1 year: Apply 1 drop daily, alternatively apply 1 drop once daily on alternate days, adjusted according to response, only 0.5% eye drops to be used
  - Child 2-17 years: Apply 1 drop twice daily, adjusted according to response

**INTERACTIONS**
- Appendix 1: homatropine

**UNLICENSED USE**
- Some preparations not licensed for use in children.

**PRESCRIBING AND DISPENSING INFORMATION**
- Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerithrytol.

### Acetylcysteine

**ACETYL L-Cysteine**

**INDICATIONS AND DOSE**

**Tear deficiency | Impaired or abnormal mucus production**

- TO THE EYE
  - Child: Apply 3–4 times a day

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye drops**

**EXCIPIENTS:** May contain benzalkonium chloride, disodium edetate.

- Ilube (Rayner Pharmaceuticals Ltd)
- Acetylcysteine 50 mg per 1 ml Ilube 5% eye drops | 10 ml [PoS] £14.93 DT price = £14.93

### Carbolmers

(Polyacrylic acid)

**INDICATIONS AND DOSE**

**Dry eyes including keratoconjunctivitis sicca, unstable tear film**

- TO THE EYE
  - Child: Apply 3–4 times a day or when required

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye gel**

**EXCIPIENTS:** May contain benzalkonium chloride, cetrimide, disodium edetate.

- Blephagel (Thea Pharmaceuticals Ltd)
  - Carbomer 3.5 mg per 1 gram Blephagel 0.35% eye gel | 40 gram £6.66
  - Carbomer 3.6 mg per 1 gram Blephagel 0.36% eye gel preservative free | 30 gram £7.53
- Liquivisc (Thea Pharmaceuticals Ltd)
  - Carbomer 974P 2.5 mg per 1 gram Liquivisc 0.25% eye gel | 10 gram [P] £4.50 DT price = £4.50

**Eye drops**

- Carboromer (Non-proprietary)
  - Carbomer 980 2 mg per 1 gram EyeGel 0.2% eye gel | 10 gram £2.80 DT price = £2.80
  - Carbomer 980 0.2% eye drops | 10 gram [P] £2.80 DT price = £2.80
  - Artelac Nighttime (Bausch & Lomb UK Ltd)
  - Carbomer 980 2 mg per 1 gram Artelac Nighttime 0.2% eye gel | 10 gram £2.96 DT price = £2.96
  - Carbomer 980 0.2% eye gel | 10 gram £2.80 DT price = £2.80

- GelTears (Bausch & Lomb UK Ltd)
  - Carbomer 980 2 mg per 1 gram GelTears 0.2% gel | 10 gram £2.80 DT price = £2.80
  - Carbomer 980 0.2% eye gel | 10 gram £2.80 DT price = £2.80
  - Clinitas Carbomer (Alcator Ltd)
  - Carbomer 980 2 mg per 1 gram Clinitas Carbomer 0.2% eye gel | 10 gram £1.49 DT price = £1.49

- Viscotears (Bausch & Lomb UK Ltd)
  - Carbomer 980 2 mg per 1 gram Viscotears 2mg/g liquid gel | 10 gram [P] £1.59 DT price = £1.59
  - Viscotears 2mg/g eye gel 0.6ml unit dose | 30 unit dose [P] £5.42 DT price = £5.42

### Dry eye conditions

#### Dry eye

**Tear deficiency, ocular lubricants, and astringents**

Chronic soreness of the eyes associated with reduced or abnormal tear secretion often responds to tear replacement therapy. The severity of the condition and child’s preference will often guide the choice of preparation.

Hypermellose p. 643 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypermellose with a mucolytic such as acetylcysteine below can be helpful.

The ability of carboromers to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol p. 644 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 645 are also used in the management of tear deficiency.

Sodium chloride 0.9% drops p. 645 are sometimes useful in tear deficiency, and can be used as ‘comfort drops’ by contact lens wearers, and to facilitate lens removal. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery and in first aid for removal of harmful substances.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.
Hydroxyethylcellulose

● INDICATIONS AND DOSE
Tear deficiency
  ➤ TO THE EYE
  ➤ Child: Apply as required

● PRESCRIBING AND DISPENSING INFORMATION
Although multi-dose hydroxyethylcellulose eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Eye drops
  ➤ Artificial tears (Bausch & Lomb UK Ltd)
  Hydroxyethylcellulose 4.4 mg per 1 ml Minims artificial tears 0.44% eye drops 0.5ml unit dose | 20 unit dose £ 8.97

Hydroxypropyl guar with polyethylene glycol and propylene glycol
(Formulated as an ocular gel)

● INDICATIONS AND DOSE
Dry eye conditions
  ➤ TO THE EYE
  ➤ Child: Apply as required

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Eye drops
  ➤ Systane (Novartis Pharmaceuticals UK Ltd)
  Systane Gel eye drops | 10 ml £ 7.49

Hypermellose

● INDICATIONS AND DOSE
Tear deficiency
  ➤ TO THE EYE
  ➤ Child: Apply as required

● PRESCRIBING AND DISPENSING INFORMATION
The Royal Pharmaceutical Society has stated that where it is not possible to ascertain the strength of hypermellose prescribed, the prescriber should be contacted to clarify the strength intended.

Although multi-dose hypermellose eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops
EXCIPIENTS: May contain Benzalkonium chloride, cetrimide, disodium edetate
  ➤ Hypermellose (Non-proprietary)
  Hypermellose 3 mg per 1 ml Hypermellose 0.3% eye drops preservative free | 10 ml £ 5.75

Hypermellose 3 mg per 1 ml Xailin Hydrate 0.3% eye drops preservative free | 10 ml £4.60

Hypermellose with dextran 70

The properties listed below are those particular to the combination only. For the properties of the components please consider, hypermellose p. 643.

**INDICATIONS AND DOSE**

Tear deficiency

▶ TO THE EYE

Child: Apply as required

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

▶ Lacri-Lube (Allergan Ltd)

Wool alcohols 2 mg per 1 gram, Liquid paraffin 425 mg per 1 gram, White soft paraffin 573 mg per 1 gram. Lacri-lube eye ointment | 3.5 gram £2.94 | 5 gram £3.88

Liquid paraffin with white soft paraffin and wool alcohols

**INDICATIONS AND DOSE**

Dry eye conditions

▶ TO THE EYE

Child: Apply as required, best suited for application before sleep

**PATIENT AND CARER ADVICE** May cause temporary visual disturbance. Should not be used during contact lens wear.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

▶ Paraffin, yellow, soft (Non-proprietary)

Liquid paraffin 100 mg per 1 gram, Wool fat 100 mg per 1 gram, Yellow soft paraffin 800 mg per 1 gram. Simple eye ointment | 4 gram £17.45 DT price = £14.12

Polyvinyl alcohol

**INDICATIONS AND DOSE**

Tear deficiency

▶ TO THE EYE

Child: Apply as required

**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose polyvinyl alcohol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ Liquifilm Tears (Allergan Ltd)

Polyvinyl alcohol 14 mg per 1 ml Liquifilm Tears 1.4% eye drops | 15 ml £1.93

Liquifilm Tears 1.4% eye drops 0.4ml unit dose preservative free | 30 unit dose £5.35

▶ PVA (Tubulix Pharma Ltd)

Polyvinyl alcohol 14 mg per 1 ml PVA 1.4% eye drops | 15 ml £1.63

Polyvinyl alcohol 14 mg per 1 ml Refresh Ophthalmic 1.4% eye drops 0.4ml unit dose | 30 unit dose £2.25

▶ Sno Tears (Bausch & Lomb UK Ltd)

Polyvinyl alcohol 14 mg per 1 ml Sno Tears 1.4% eye drops | 10 ml £1.06

Retinol palmitate with white soft paraffin and light liquid paraffin and liquid paraffin and wool fat

(Formulated as an ocular lubricant)
**Dry eye conditions 645**

**Sodium hyaluronate**

**INDICATIONS AND DOSE**

**Dry eye conditions**

- **To the eye**
- **Child**: Apply as required

**PRESCRIBING AND DISPENSING INFORMATION**

Some preparations are contained in units which are resealable and may be used for up to 12 hours.

Although multi-dose sodium hyaluronate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **Sodium hyaluronate (Non-proprietary)**
  - Sodium hyaluronate 50 mg per 1 ml: Sodium hyaluronate 5% eye drops | 10 ml £9.45
  - Hypersal (Emmgen Healthcare Ltd): Sodium hyaluronate 50 mg per 1 ml: Hypersal 5% eye drops | 10 ml £9.45
  - ODMS (Kestrel Ophthalmics Ltd): Sodium hyaluronate 50 mg per 1 ml: ODMS 5% eye drops preservative free | 10 ml £10.75
  - Saline (Bausch & Lomb UK Ltd): Sodium hyaluronate 9 mg per 1 ml: Minims saline 0.9% eye drops 0.5ml unit dose | 20 unit dose: £7.14
  - Saline (Bausch & Lomb UK Ltd): Sodium hyaluronate 9 mg per 1 ml: Saline 0.9% eye drops 0.5ml unit dose | 20 unit dose: £7.14
  - Sodium hyaluronate (Essential Pharmaceuticals Ltd, Moorfields Pharmaceuticals): Sodium hyaluronate 50 mg per 1 ml: NaCl 5% eye drops 0.45ml unit dose preservative free | 20 unit dose: £19.70
  - PF Drops Sodium Chloride 5% eye drops preservative free | 10 ml: £11.25
  - Vizulize (East Midlands Pharma): Vizuline 0.1% eye drops | 10 ml: £1.75
  - Xaline HA (Nicox Pharma): Xaline HA 1% eye drops preservative free | 10 ml: £7.15

**Eye ointment**

- **Sodium hyaluronate (Non-proprietary)**
  - Sodium hyaluronate 50 mg per 1 gram: Muro 128 5% eye ointment | 3.5 gram: £0.80
  - Sodium hyaluronate 50 mg per 1 ml: Sodium hyaluronate 5% eye ointment preservative free | 5 gram: £22.50

**Soybean oil**

**INDICATIONS AND DOSE**

**Dry eye conditions**

- **To the eye**
- **Child**: Apply up to 4 times a day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **Emustil** (Moorfields Pharmaceuticals): Emustil eye drops 0.3% unit dose preservative free | 20 unit dose: £6.22
3  Eye infections

Eye infections

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial blepharitis is treated by lid hygiene and application of antibiotic eye drops to the conjunctival sac or to the lid margins. Systemic treatment may be required and may be necessary for 3 months or longer.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibiotic eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis or antibiotic resistance.

Corneal ulcer and keratitis require specialist treatment, usually under inpatient care, and may call for intensive topical, subconjunctival, or systemic administration of antimicrobials.

Endophthalmitis is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

See reference to the treatment of crab lice of the eyelashes.

Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 648 has a broad spectrum of activity and is the drug of choice for superficial eye infections. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 647, levofloxacin p. 648, moxifloxacin p. 648, and ofloxacin p. 648; the aminoglycosides, gentamicin p. 647 and tobramycin p. 647 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and polymyxin B are effective for infections caused by Pseudomonas aeruginosa.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 647 are licensed for trachomatous conjunctivitis caused by Chlamydia trachomatis and for purulent bacterial conjunctivitis. Trachoma which results from chronic infection with Chlamydia trachomatis can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamidine isethionate p. 649 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of acanthamoeba keratitis [unlicensed indication].

Other antibacterial eye drops may be prepared aseptically in a specialist manufacturing unit from material supplied for injection.

With corticosteroids

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should not be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- **Eye drops**, apply 1 drop at least every 2 hours in severe infection then reduce frequency as infection is controlled and continue for 48 hours after healing. For less severe infection 3–4 times daily is generally sufficient.
- **Eye ointment**, apply either at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

Antifungals

Fungal infections of the cornea are rare. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Debility or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent in Scotland or Northern Ireland), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (tel. (020) 7253 3411) or www.moorfields.nhs.uk.

Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 649. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Also see systemic treatment of CMV retinitis.

Antibacterials in neonates

Antibacterial eye drops are used to treat acute bacterial conjunctivitis in neonates (ophthalmia neonatorum); where possible the causative microorganism should be identified. Chloramphenicol eye drops are used to treat mild conjunctivitis; more serious infections also require a systemic antibacterial. Failure to respond to initial treatment requires further investigation; chlamydial infection is one of the most frequent causes of neonatal conjunctivitis and should be considered. Azithromycin eye drops are licensed to treat trachomatous conjunctivitis caused by Chlamydia trachomatis and purulent bacterial conjunctivitis in neonates. However, as there is a risk of simultaneous infection at other sites in neonates and children under 3 months presenting with conjunctivitis caused by Chlamydia trachomatis, systemic treatment with oral erythromycin p. 316 is required. Gonococcal eye infections are treated with a single-dose of parenteral cefotaxime p. 307 or ceftriaxone p. 308. Gentamicin eye drops together with appropriate systemic antibacterials are used in the treatment of pseudomonal eye infections; high-strength gentamicin eye drops (1.5%) [unlicensed] are available for severe infections.
3.1 Bacterial eye infection

ANTIBACTERIALS > AMINGLYCOSIDES

Gentamicin

- INDICATIONS AND DOSE
  - Bacterial eye infections
    - TO THE EYE
    - Child: Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

- INTERACTIONS → Appendix 1: aminoglycosides

- PRESCRIBING AND DISPENSING INFORMATION
  - Eye drops may be sourced as a manufactured special or from specialist import companies.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

  **Ear/eye drops solution**
  - **EXCIPIENTS:** May contain Benzalkonium chloride
    - **Gentamicin (Non-proprietary)**
      - Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml
  - **Gentamicin 0.3% ear/eye drops**
    - 10 ml [UK] £2.14 DT price = £2.15

Tobramycin

- INDICATIONS AND DOSE
  - Local treatment of infections
    - TO THE EYE
    - Child 1–17 years: Apply twice daily for 6–8 days
  - Local treatment of infections (severe infection)
    - TO THE EYE
    - Child 1–17 years: Apply 4 times a day for first day, then apply twice daily for 5–7 days

- INTERACTIONS → Appendix 1: aminoglycosides

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**
  - **EXCIPIENTS:** May contain Benzododecinium bromide
    - **Tobramycin (Alcon Laboratories (UK) Ltd)**
      - Tobramycin 3 mg per 1 ml
        - 15 ml [UK] £4.74

ANTIBACTERIALS > MACROLIDES

Azithromycin

- INDICATIONS AND DOSE
  - **Trachomatous conjunctivitis caused by Chlamydia trachomatis** | **Purulent bacterial conjunctivitis**
    - TO THE EYE
    - Child: Apply twice daily for 3 days, review if no improvement after 3 days

- INTERACTIONS → Appendix 1: macrolides

- SIDE-EFFECTS
  - **Common or very common**
    - Blurred vision • ocular burning • ocular discomfort • ocular pruritus
  - **Uncommon**
    - Conjunctival hyperaemia • eyelid eczema • eyelid erythema • eyelid oedema • keratitis

ANTIBACTERIALS > QUINOLONES

Ciprofloxacin

- INDICATIONS AND DOSE
  - **Superficial bacterial eye infection**
    - TO THE EYE USING EYE DROP
      - Child: Apply 4 times a day for maximum duration of treatment 21 days
    - TO THE EYE USING EYE OINTMENT
      - Child 1–17 years: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
  - **Superficial bacterial eye infection (severe infection)**
    - TO THE EYE USING EYE DROP
      - Child: Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days
    - TO THE EYE USING EYE OINTMENT
      - Child 1–17 years: Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night

- UNLICENSED USE
  - Eye ointment not licensed for use in children under 1 year.

- INTERACTIONS → Appendix 1: quinolones

- SIDE-EFFECTS
  - **Common or very common**
    - Corneal deposits (reversible after completion of treatment) • ocular discomfort • ocular hyperaemia • taste disturbance
  - **Uncommon**
    - Increased lacrimation • blurred vision • conjunctival hyperaemia • corneal infiltrates • corneal staining • eye dryness • eye irritation • eye pain • eye pruritus • eye swelling • eyelid disorders • eyelid erythema • eyelid exfoliation • eyelid oedema • headache • keratopathy • nasea • photophobia
  - **Rare**
    - Abdominal pain • asthenopia • corneal disorders • corneal epithelium defect • dermatitis • diarrhoea • diplopia • dizziness • ear pain • eye hypoesthesia • keratitis • paranasal sinus hyperscretion • rhinitis

- PREGNANCY
  - Manufacturer advises use only if potential benefit outweighs risk.

- BREAST FEEDING
  - Manufacturer advises caution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Azyter (Thea Pharmaceuticals Ltd)**
  - Azithromycin dihydrate 15 mg per 1 gram
  - Azyter 15mg/g eye drops 0.25g unit dose | 6 unit dose [UK] £6.99 DT price = £6.99

**Azyter**
- **Gentamicin (as Gentamicin sulfate)** 3 mg per 1 ml
  - Gentamicin 0.3% ear/eye drops [UK] £2.14 DT price = £2.15

**Tobramycin**
- **Ear/eye drops solution**
  - **EXCIPIENTS:** May contain Benzalkonium chloride
    - **Tobramycin (Non-proprietary)**
      - Tobramycin 3 mg per 1 ml
    - **Tobramycin 3 mg per 1 ml Tobramycin 3mg/ml eye drops**
      - 15 ml [UK] £4.74

**Ciprofloxacin**
- **Ear/eye drops solution**
  - **EXCIPIENTS:** May contain Benzalkonium chloride
    - **Ciprofloxacin (as Ciprofloxacin hydrochloride)** 3 mg per 1 ml
      - Ciprofloxacin 0.3% eye drops | 5 ml [UK] £4.70 DT price = £4.70
**Eye ointment**
- **Ciloxan** (Alcon Laboratories (UK) Ltd)
  - Ciloxan as Ciprofloxacin hydrochloride: 3 mg per 1 gram
  - Ciloxan 3mg/g eye ointment | 3.5 gram £5.22

**Levofoxacin**

- **INDICATIONS AND DOSE**
  - **Local treatment of eye infections**
  - **TO THE EYE**
  - Child 1–17 years: Apply every 2 hours for first 2 days, then reduced to 4 times a day for 3 days

- **INTERACTIONS** → Appendix 1: quinolones

- **SIDE-EFFECTS**
  - Common or very common: Ocular burning - visual disturbances
  - Uncommon: Conjunctival follicles - headache - lid erythema - lid oedema - ocular discomfort - ocular dryness - ocular itching - ocular pain - photophobia - rhinitis

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Manufacturer advises use only if potential benefit outweighs risk.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Although multi-dose levofoxacin eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain Benzalkonium chloride
  - **Levofoxacin (Non-proprietary)**
    - Levofoxacin as Levofoxacin hemihydrate: 5 mg per 1 ml
    - Oftaquix (Santen UK Ltd)
      - Levofoxacin as Levofoxacin hemihydrate: 5 mg per 1 ml
        - Oftaquix 5mg/ml eye drops: 30 ml unit dose | 30 unit dose £17.95
        - Oftaquix 5mg/ml eye drops: 5 ml £6.95

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain Benzalkonium chloride
  - **Moxifloxacin (Non-proprietary)**
    - Moxifloxacin as Moxifloxacin hydrochloride: 5 mg per 1 ml
      - Moxivig (Alcon Laboratories (UK) Ltd)
        - Moxifloxacin as Moxifloxacin hydrochloride: 5 mg per 1 ml
          - Moxivig 0.5% eye drops: 5 ml £9.80

**Ofloxacin**

- **INDICATIONS AND DOSE**
  - **Local treatment of infections**
  - **TO THE EYE**
  - Child 1–17 years: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment

- **CAUTIONS**
  - Corneal ulcer (risk of corneal perforation) - epithelial defect (risk of corneal perforation)

- **INTERACTIONS** → Appendix 1: quinolones

- **SIDE-EFFECTS**
  - Common or very common: Ocular discomfort
  - Frequency not known: Dry eyes - facial oedema - increased lacrimation - keratitis - ocular hyperaemia - ocular oedema - photophobia - visual disturbances

- **PREGNANCY**
  - Manufacturer advises use only if benefit outweighs risk (systemic quinolones have caused arthropathy in animal studies).

- **BREAST FEEDING**
  - Manufacturer advises avoid.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS:** May contain Benzalkonium chloride
  - **Ofloxacin (Non-proprietary)**
    - Ofloxacin 3 mg per 1 ml
      - Exocin (Allergan Ltd)
        - Ofloxacin 0.3% eye drops: 5 ml £2.17
        - DT price = £2.17

**ANTIBACTERIALS > OTHER**

**Chloramphenicol**

- **DRUG ACTION**
  - Chloramphenicol is a potent broad-spectrum antibiotic.

- **INDICATIONS AND DOSE**
  - **Superficial eye infections**
    - **TO THE EYE USING EYE DROP**
    - Child: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient
    - **TO THE EYE USING EYE OINTMENT**
    - Child: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

- **INTERACTIONS** → Appendix 1: chloramphenicol

- **SIDE-EFFECTS**
  - Transient stinging

- **PREGNANCY**
  - Avoid unless essential—no information on topical use but risk of ‘neonatal grey-baby syndrome’ with oral use in third trimester.

- **BREAST FEEDING**
  - Avoid unless essential—theoretical risk of bone-marrow toxicity.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Although multi-dose chloramphenicol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
PATIENT AND CARER ADVICE

Medicines for Children leaflet: Chloramphenicol for eye infections
www.medicinesforchildren.org.uk/chloramphenicol-eye-infections-0

EXCEPTIONS TO LEGAL CATEGORY

Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.

MEDIACAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops
EXCIPIENTS: May contain Phenylmercuric acetate
- Chloramphenicol (Non-proprietary)
  Chloramphenicol 5 mg per 1 ml Minims chloramphenicol 0.5% eye drops 0.5ml unit dose | 20 unit dose (Pod) £10.99 DT price = £10.99
  Chloramphenicol Antibiotic 0.5% eye drops | 10 ml (P) £1.70 DT price = £1.52
- Chloramphenicol 0.5% eye drops | 10 ml (Pod) £2.20 DT price = £1.52
- Chloromycetin (AMCo)

- Chloramphenicol (AMCo)
  Chloramphenicol 10 mg per 1 gram Chloramphenicol 1% eye ointment | 4 gram (Pod) £1.08 DT price = £2.27
- Klorafect (Blumont Pharma Ltd)
  Chloramphenicol 10 mg per 1 gram  Klorafect 1% eye ointment | 4 gram (Pod) £1.81 DT price = £2.27

Eye ointment
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Fusidic acid
  Fusidic acid 10 mg per 1 gram Fusidic acid 1% modified-release eye drops | 5 gram (Pod) £29.06 DT price = £29.06

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Antiprotzoals

Propamidine isetionate

INDICATIONS AND DOSE

Acanthamoeba keratitis infections (specialist use only)
- TO THE EYE USING EYE OINTMENT
  - Child: Apply 1–2 times a day
- TO THE EYE USING EYE DROP
  - Child: Apply up to 4 times a day

UNLICENSED USE

Not licensed for acanthamoeba keratitis infections.

SIDE-EFFECTS

Eye irritation - eye pain

PREGNANCY

Manufacturer advises avoid unless essential—no information available.

BRACETEADING

Manufacturer advises avoid unless essential—no information available.

ANTIVIRALS

3.2 Viral eye infection
3.2a Ophthalmic herpes simplex

Aciclovir
(Acyclovir)

INDICATIONS AND DOSE

Herpes simplex infection (local treatment)
- TO THE EYE USING EYE OINTMENT
  - Child: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing

INTERACTIONS

Appendix 1: aciclovir

SIDE-EFFECTS

- Common or very common Local inflammation - local irritation - superficial punctate keratopathy
- Rare Blepharitis
- Very rare Angioedema - hypersensitivity reactions

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Aciclovir eye ointment for herpes simplex infections www.medicinesforchildren.org.uk/aciclovir-eye-ointment-for-herpes-simplex-infection

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment
- Zovirax (GlaxoSmithKline Ltd)
  Aciclovir 30 mg per 1 gram Zovirax 3% ophthalmic ointment | 4.5 gram (Pod) £9.34 DT price = £9.34

4 Eye procedures

Mydriatics and cycloplegics

Overview

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide 0.5% p. 650 (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye.

Cyclopentolate hydrochloride 1% p. 641 (action up to 24 hours) or atropine sulfate p. 641 (action up to 7 days) are
preferable for producing cycloplegia for refraction in young children; tropicamide may be preferred in neonates.
Phenylephrine hydrochloride p. 651 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.
Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 642 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

ANTIMUSCARINICS

Tropicamide

- INDICATIONS AND DOSE
  Funduscopv
  TO THE EYE
  - Neonate: 0.5% eye drops to be applied 20 minutes before examination.
  - Child: 0.5% eye drops to be applied 20 minutes before examination.

- INTERACTIONS → Appendix 1: tropicamide
- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Eye drops
  EXCIPIENTS: May contain Benzalkonium chloride, edetic acid (edta)
  - Mydriacyl (Alcon Laboratories (UK) Ltd)
    Tropicamide 5 mg per 1 ml Mydriacyl 0.5% eye drops | 5 ml
    £1.29
  - Tropicamide 10 mg per 1 ml Mydriacyl 1% eye drops | 5 ml
    £1.60
  - Tropicamide (Bausch & Lomb UK Ltd)
    Tropicamide 5 mg per 1 ml Minims tropicamide 0.5% eye drops 0.5ml unit dose | 20 unit dose
    £0.75
    Tropicamide 10 mg per 1 ml Minims tropicamide 1% eye drops 0.5ml unit dose | 20 unit dose
    £0.77

ANTISEPTICS AND DISINFECTANTS → IODINE PRODUCTS

Povidone-iodine

- INDICATIONS AND DOSE
  Cutaneous peri-ocular and conjunctival antisepsis before ocular surgery
  TO THE EYE
  - Neonate: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%.
  - Child: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

- CONTRA-INDICATIONS Concomitant use of ocular antimicrobial drugs - concomitant use of ocular formulations containing mercury-based preservatives - preterm neonates
- SIDE-EFFECTS
  - Rare Conjunctival hyperaemia - superficial punctuate keratitis
  - Frequency not known Cytotoxicity on deep tissue - cytotoxicity on mucous membranes - hypothyroidism in neonates - residual yellow coloration of the conjunctiva

- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose povidone iodine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
  Eye drops
  - Povidone iodine (Bausch & Lomb UK Ltd)
    Povidone-Iodine 50 mg per 1 ml Minims povidone iodine 5% eye drops 0.4ml unit dose | 20 unit dose
    £16.00

DIAGNOSTIC AGENTS → DYES

Fluorescein sodium

- INDICATIONS AND DOSE
  Detection of lesions and foreign bodies
  TO THE EYE USING EYE DROP
  - Child: Use sufficient amount to stain damaged areas.

- PRESCRIBING AND DISPENSING INFORMATION Although multi-dose fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Eye drops
  - Fluorescein sodium (Bausch & Lomb UK Ltd)
    Fluorescein sodium 10 mg per 1 ml Minims fluorescein sodium 1% eye drops 0.5ml unit dose | 20 unit dose
    £8.89
    Fluorescein sodium 20 mg per 1 ml Minims fluorescein sodium 2% eye drops 0.5ml unit dose | 20 unit dose
    £8.89

MIOTICS → PARASYMPATHOMIMETICS

Acetylcholine chloride

- INDICATIONS AND DOSE
  Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis
  TO THE EYE
  - Child: (consult product literature)

- UNLICENSED USE
  Not licensed for use in children.
- CAUTIONS
  Asthma - gastro-intestinal spasm - heart failure - hyperthyroidism - peptic ulcer - urinary-tract obstruction
- INTERACTIONS → Appendix 1: acetylcholine
- PREGNANCY
  Avoid unless potential benefit outweighs risk—no information available.
- BREAST FEEDING
  Avoid unless potential benefit outweighs risk—no information available.
- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Irrigation
  - Miochol-E (Bausch & Lomb UK Ltd)
    Acetylcholine chloride 20 mg Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 1 vial
    £7.28
  - Miphtel (Alan Pharmaceuticals)
    Acetylcholine Chloride 20 mg Miphtel 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoule
    £43.68 (Hospital only)
SYMPATHOMIMETICS > VASOCONSTRICTOR

Phenylephrine hydrochloride

- INDICATIONS AND DOSE
  - Mydriasis
    - TO THE EYE
    - Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging
  - CONTRA-INDICATIONS 10% strength eye drops in children
  - 10% strength eye drops in neonates
  - aneurysms
  - cardiovascular disease
  - hypertension
  - thyrotoxicosis
  - CAUTIONS Asthma
  - corneal epithelial damage
  - darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdose.
  - diabetes (avoid eye drops in long standing diabetes)
  - mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber
  - neonates are at an increased risk of systemic toxicity
  - ocular hyperaemia
  - susceptibility to angle-closure glaucoma
  - INTERACTIONS → Appendix 1: sympathomimetics, vasoconstrictor
  - SIDE-EFFECTS Arrhythmias
  - blurred vision
  - conjunctivitis on prolonged administration
  - coronary artery spasm
  - extrasystoles
  - hyperaemia on prolonged administration
  - hypertension
  - local irritation on prolonged administration
  - myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease)
  - oedema on prolonged administration
  - palpitation
  - photophobia
  - raised intraocular pressure
  - tachycardia
  - transient stinging
  - PREGNANCY Use only if potential benefit outweighs risk.
  - BREAST FEEDING Use only if potential benefit outweighs risk—no information available.
  - PRESCRIBING AND DISPENSING INFORMATION
    - Although multi-dose phenylephrine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
  - PATIENT AND CARER ADVICE
    - Driving and skilled tasks
    - Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.
  - MEDICINAL FORMS
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
    - Eye drops
      - EXCipients: May contain Disodium edetate, sodium metabisulfite
        - Phenylephrine hydrochloride (Bausch & Lomb UK Ltd)
        - Phenylephrine hydrochloride 0.25% eye drops 0.5ml unit dose
    - Sodium hyaluronate p. 645 is used during surgical procedures on the eye.
    - Apraclonidine p. 658, an alpha₂-adrenoceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used for short-term treatment only.
    - Balanced Salt Solution is used routinely in intra-ocular surgery.
    - Povidone-iodine p. 650 is used for peri-ocular and conjunctival antisepsis before ocular surgery to support postoperative infection control.

Local anaesthetics

Oxybuprocaine hydrochloride below and tetracaine p. 652 are widely used topical local anaesthetics. Proxymetacaine hydrochloride p. 652 causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride p. 796 and fluorescein sodium p. 650 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 132, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms. Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

ANAESTHETICS, LOCAL

Fluorescein with lidocaine

- INDICATIONS AND DOSE
  - Local anaesthesia
    - TO THE EYE
    - Child: Apply as required
  - CONTRA-INDICATIONS Avoid in pre-term neonate (immature metabolising enzyme system)
  - PRESCRIBING AND DISPENSING INFORMATION
    - Although multi-dose lidocaine and fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
  - MEDICINAL FORMS
    - There can be variation in the licensing of different medicines containing the same drug.
    - Eye drops
      - Lidocaine and Fluorescein (Bausch & Lomb UK Ltd)
      - Fluorescein sodium 2.5 mg per 1 ml, Lidocaine hydrochloride
      - 40 mg per 1 ml Minims lidocaine and fluorescein eye drops 0.5ml unit dose
        - 20 unit dose £11.41
  - Pharmacological action
    - Proxymetacaine is a sympathomimetic, vasoconstrictor
    - Fluorescein is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms. Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

4.1 Post-operative pain and inflammation

Eye, surgical and peri-operative drug use

Ocular peri-operative drugs

Drugs used to prepare the eye for surgery and drugs that are injected into the anterior chamber at the time of surgery are included here.
Contra-indicated in hypersensitivity (Bausch & Lomb UK Ltd)

Although not licensed for use in children.

Not licensed for use in neonates.

Avoid in preterm neonates

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

**Oxybuprocaine hydrochloride** (Bausch & Lomb UK Ltd)

Oxybuprocaine hydrochloride 4 mg per 1 ml Minims oxybuprocaine hydrochloride 0.4% eye drops 0.5ml unit dose | 20 unit dose

**Proxymetacaine hydrochloride**

**INDICATIONS AND DOSE**

Local anaesthetic

- **TO THE EYE**
- **Child:** Apply as required

**CONTRA-INDICATIONS**

Avoid in preterm neonates

**INTERACTIONS**

- Appendix 1: anaesthetics, local

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose proxymetacaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- **Proxymetacaine** (Bausch & Lomb UK Ltd)

Proxymetacaine hydrochloride 5 mg per 1 ml Minims proxymetacaine 0.5% eye drops 0.5ml unit dose | 20 unit dose

**Tetracaine**

*(Amethocaine)*

**INDICATIONS AND DOSE**

Local anaesthetic

- **TO THE EYE**
- **Child:** Apply as required

**UNLICENSED USE**

Not licensed for use in neonates.

**CONTRA-INDICATIONS**

Avoid in preterm neonates

**INTERACTIONS**

- Appendix 1: anaesthetics, local

**SIDE-EFFECTS**

Local skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems; systemic side effects unlikely as minimal absorption following topical application.

**ALLERGY AND CROSS-SENSITIVITY**

Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose tetracaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- **Tetracaine (Non-proprietary)**

Tetracaine hydrochloride 5 mg per 1 ml Minims tetracaine hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose

**Diclofenac sodium**

**INDICATIONS AND DOSE**

Inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties) | Postoperative inflammation in cataract surgery, strabismus surgery, argon laser trabeculoplasty

- **TO THE EYE**
- **Child:** (consult product literature)

**UNLICENSED USE**

Not licensed for use in children.

**INTERACTIONS**

- Appendix 1: NSAIDs

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose diclofenac sodium eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- **Ocufen (Allergan Ltd)**

Flurbiprofen sodium 300 microgram per 1 ml Ocufen 0.03% eye drops 0.4ml unit dose | 40 unit dose

**Flurbiprofen**

**INDICATIONS AND DOSE**

Inhibition of intra-operative miosis (but does not possess intrinsic mydriatic properties) | Control of anterior segment inflammation following postoperative and post-laser trabeculoplasty when corticosteroids contra-indicated

- **TO THE EYE**
- **Child:** (consult product literature)

**UNLICENSED USE**

Not licensed for use in children.

**INTERACTIONS**

- Appendix 1: NSAIDs

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- **Ocufen (Allergan Ltd)**

Flurbiprofen sodium 300 microgram per 1 ml Ocufen 0.03% eye drops 0.4ml unit dose | 40 unit dose

**Analgesics > Non-steroidal anti-inflammatory drugs**

Tetracaine hydrochloride 10 mg per 1 ml Minims tetracaine hydrochloride 1% eye drops 0.5ml unit dose | 20 unit dose

£10.15
Ketorolac trometamol

- **INDICATIONS AND DOSE**
  - Prophylaxis and reduction of inflammation and associated symptoms following ocular surgery
  - TO THE EYE
  - Child: (consult product literature)

- **UNLICENSED USE** Not licensed for use in children.

- **INTERACTIONS** → Appendix 1: NSAIDs

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - **EXCIPIENTS:** May contain Benzalkonium chloride, disodium edetate
    - **Acular (Allergan Ltd)**
      - Ketorolac trometamol 5 mg per 1 ml Acular 0.5% eye drops | 5 ml (Box) £3.00 DT price = £3.00

### 5 Glaucoma and ocular hypertension

#### Glaucoma

**Overview**

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage and is generally associated with raised intra-ocular pressure.

Glaucoma is rare in children and should always be managed by a specialist. **Primary congenital glaucoma** is the most common form of glaucoma in children, followed by **secondary glaucomas**, such as following hereditary anterior segment malformations; **juvenile open-angle glaucoma** is less common and usually occurs in older children.

Treatment of glaucoma is determined by the pathophysiology and usually involves controlling raised intra-ocular pressure with surgery. Drug therapy is generally supportive, and can be used temporarily, pre- or post-operatively, or both, to reduce intra-ocular pressure. In secondary glaucomas, drug therapy is often used first-line, and long-term treatment may be required. Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue can be used. It may be necessary to combine these drugs or add others, such as carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Children with an acute form of glaucoma (usually presenting with pain in older children, a cloudy cornea, and may be associated with a previous history of controlled glaucoma or recent intra-ocular surgery) need immediate referral for specialist ophthalmology assessment and treatment.

**Beta-blockers**

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary and secondary glaucomas, probably by reducing the rate of production of aqueous humour.

**Prostaglandin analogues**

The prostaglandin analogues latanoprost p. 657, and travoprost, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure. Only latanoprost (Xalatan® and certain non-proprietary preparations of latanoprost) is licensed for use in children. Children receiving prostaglandin analogues should be managed by a specialist.

**Sympathomimetics**

Apraclonidine p. 658 is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used for a short period to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

Brimonidine tartrate, an alpha₂-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

**Carbonic anhydrase inhibitors and systemic drugs**

The carbonic anhydrase inhibitors, acetazolamide p. 655, brinzolamide p. 656, and dorzolamide p. 656, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

Acetazolamide is given by mouth or, rarely in children, by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are unlicensed in children but are used in those resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

Metabolic acidosis can occur in children using topical carbonic anhydrase inhibitors; symptoms may include poor feeding and lack of weight gain.

**Miotics**

Miotics act by opening up the inefficient drainage channels in the trabecular meshwork. Pilocarpine p. 657 is a miotic used pre- and post-operatively in goniotomy and trabeculotomy; it is used occasionally for aphakic glaucoma.

**BETA-ADRENOCEPTOR BLOCKERS**

**Betaxolol**

- **INDICATIONS AND DOSE**
  - Primary and secondary glaucomas
  - TO THE EYE
  - Child: Apply twice daily

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

- **CAUTIONS** Patients with corneal disease

_Cautions, Further Information_ Systemic absorption can follow topical application to the eyes; consider cautions listed for systemically administered beta blockers.

- **INTERACTIONS** → Appendix 1: beta blockers (selective)
**Levobunolol hydrochloride**

- **INDICATIONS AND DOSE**
  Primary and secondary glaucomas
  - TO THE EYE
  - Child: Apply 1–2 times a day

- **UNLICENSED USE**
  Not licensed for use in children.

- **CONTRA-INDICATIONS**
  Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

- **CAUTIONS**
  Patients with corneal disease

**Side-effects, Further Information**
Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose (Levobunolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

- BETAGAN (Allergan Ltd)
  Levobunolol hydrochloride 5 mg per 1 ml Levobunol 0.5% eye drops | 5 ml (PoS) £1.85 DT price = £1.85
  Levobunol Unit Dose 0.5% eye drops 0.4ml unit dose | 30 unit dose (PoS) £9.98

**Carteolol hydrochloride**

- **INDICATIONS AND DOSE**
  Primary and secondary glaucomas
  - TO THE EYE
  - Child: Apply twice daily

- **UNLICENSED USE**
  Not licensed for use in children.

- **CONTRA-INDICATIONS**
  Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

- **CAUTIONS**
  Patients with corneal disease

**Side-effects, Further Information**
Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose (Carteolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

- Betoptic (Allergan Laboratories (UK) Ltd)
  Betoptic (as Betaxolol hydrochloride) 2.5 mg per 1 ml Betoptic 0.25% suspension eye drops | 5 ml (PoS) £2.66 DT price = £2.66
  Betoptic 0.25% eye drops suspension 0.25ml unit dose | 50 unit dose (PoS) £13.77

- Betoptic (as Betaluxol hydrochloride) 5 mg per 1 ml Betoptic 0.5% eye drops | 5 ml (PoS) £1.90 DT price = £1.90

**Timolol maleate**

- **INDICATIONS AND DOSE**
  Primary congenital and primary juvenile glaucoma, for a transitional period, before surgery or following failed surgery
  - TO THE EYE
  - Child: (consult product literature)

**Side-effects, Further Information**
Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose (Timolol) eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, sodium metabisulfite

- Teoptic (Thea Pharmaceuticals Ltd)
  Carteolol hydrochloride 10 mg per 1 ml Teoptic 1% eye drops | 5 ml (PoS) £7.60 DT price = £7.60
  Carteolol hydrochloride 20 mg per 1 ml Teoptic 2% eye drops | 5 ml (PoS) £8.40 DT price = £8.40
Reduction of intra-ocular pressure in primary and secondary glaucoma (specialist use only)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION**
  - Child 1 month–11 years: 5 mg/kg 2–4 times a day, adjusted according to response; maximum 750 mg per day
  - Child 12–17 years: 250 mg 2–4 times a day

**Raised intracranial pressure**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION**
  - Child 1 month–11 years: Initially 8 mg/kg 3 times a day, then increased if necessary up to 100 mg/kg daily

**UNLICENSED USE** Not licensed for the treatment of glaucoma.

**CONTRA-INDICATIONS**
- Adrenocortical insufficiency
- Hyperchloraemic acidosis
- Hypokalaemia
- Hyponatraemia
- Long-term administration in chronic angle-closure glaucoma

**CAUTIONS**
- Avoid extravasation at injection site (risk of necrosis), diabetes mellitus, impaired alveolar ventilation (risk of acidosis)
- Not generally recommended for long-term use
- Pulmonary obstruction (risk of acidosis), renal calculi

**INTERACTIONS**
- Appendix 1: beta blockers (non-selective)

**SIDE-EFFECTS**
- Anaphylaxis, blepharoconjunctivitis
- Cough
- May occur—dry eyes, erythema, itching, ocular stinging

**SIDE-EFFECTS, FURTHER INFORMATION**

- Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**BREAST FEEDING**
- Manufacturer advises avoidance.

**NATIONAL FUNDING/ACCESS DECISIONS**

**TIOPEX®**

**Scottish Medicines Consortium (SMC) Decisions**

- The Scottish Medicines Consortium has advised (February 2014) that timolol gel eye drops (Tiopex®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye gel**

- **EXCIPIENTS**: May contain Benzodocinidium bromide
  - **Timolol-LA** (Santen UK Ltd)
  - **Timolol (as Timolol maleate)** 2.5 mg per 1 ml Timplol-LA 0.25% ophthalmic gel-forming solution | 2.5 ml (Pod) £3.12 DT price = £3.12
  - **Timolol (as Timolol maleate)** 5 mg per 1 ml Timolol-LA 0.5% ophthalmic gel-forming solution | 2.5 ml (Pod) £3.12 DT price = £3.12

**Eye drops**

- **EXCIPIENTS**: May contain Benzalkonium chloride
  - **Timolol maleate (Non-proprietary)**
  - **Timolol (as Timolol maleate)** 2.5 mg per 1 ml Timolol 0.25% eye drops | 5 ml (Pod) £1.76 DT price = £1.43
  - **Timolol (as Timolol maleate)** 5 mg per 1 ml Timolol 0.5% eye drops | 5 ml (Pod) £1.95 DT price = £1.25
  - **Timolol** (Santen UK Ltd)
  - **Timolol (as Timolol maleate)** 2.5 mg per 1 ml Timolol 0.25% eye drops | 5 ml (Pod) £3.12 DT price = £1.43
  - **Timolol Unit Dose** 0.25% ophthalmic solution 0.2ml unit dose | 30 unit dose (£) £8.45 DT price = £8.45
  - **Timolol (as Timolol maleate)** 5 mg per 1 ml Timolol 0.5% eye drops | 5 ml (Pod) £3.12 DT price = £1.25
  - **Timolol Unit Dose** 0.5% ophthalmic solution 0.2ml unit dose | 30 unit dose (£) £9.65 DT price = £9.65
  - **Tiopex** (Thea Pharmaceuticals Ltd)
  - **Timolol (as Timolol maleate)** 1 mg per 1 gram Tiopex 1mg/g eye gel 0.4g unit dose | 30 unit dose (£) £7.49 DT price = £7.49

**Combinations available: Dorzolamide with timolol**, p. 657

**CARBONIC ANHYDRASE INHIBITORS**

**Acetazolamide**

**INDICATIONS AND DOSE**

- **Glucoma**
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12–17 years: 250–500 mg daily

- **Epilepsy**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION**

- **Neonate**: Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day.

- **Child 1 month–11 years**: Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day; maximum 750 mg per day

- **Child 12–17 years**: 250 mg 2–4 times a day

**Monitored blood count and**

**SIDE-EFFECTS**

- **Common or very common** Ataxia, depression, diarrhoea, dizziness, excitement, fatigue, flushing, headache, irritability, loss of appetite, nausea, paraesthesia, polyuria, taste disturbance, thirst, vomiting

- **Uncommon**
  - Blood disorders
  - Bone marrow suppression
  - Confusion, crystaluria, drowsiness, electrolyte disturbances on long-term therapy; fever, glycosuria, haematuria, hearing disturbances, melaena, metabolic acidosis, rash, renal calculus, renal colic, renal failure, renal lesions, Stevens-Johnson syndrome, toxic epidermal necrosis, urticarial rash

- **Rare**
  - Cholestatic jaundice, convulsions, facial paralysis, fulminating hepatic necrosis, hepatitis, photosensitivity

**Frequency not known** Transient myopia

**SIDE-EFFECTS, FURTHER INFORMATION**

- Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-effects occur occasionally—patients should be told to report any unusual skin rash.

- If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering potassium bicarbonate (as effervescent potassium tablets).

**ALLERGY AND CROSS-SENSITIVITY**

- Contra-indicated if history of sulfonamide hypersensitivity.

**PREGNANCY**

- Manufacturer advises avoid, especially in first trimester (toxicity in animal studies).

**BREAST FEEDING**

- Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

- Manufacturer advises avoid.

**RENAL IMPAIRMENT**

- Avoid—risk of metabolic acidosis.

**MONITORING REQUIREMENTS**

- Monitor blood count and plasma electrolyte concentrations with prolonged use.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**
  - **3**
  - **Acetazolamide 250 mg** Acetazolamide 250mg tablets | 112 tablet (£) £75.36 DT price = £82.20

- **Powder for solution for injection**
  - **Diamox (AMCo)**
  - **Acetazolamide 500 mg** Diamox Sodium Parenteral 500mg powder for solution for injection vials | 1 vial (£) £14.76
Dorzolamide

● INDICATIONS AND DOSE
Raised intra-ocular pressure in primary and secondary glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated
  ▶ TO THE EYE
  ▶ Child: Apply 3 times a day

Raised intra-ocular pressure in primary and secondary glaucoma as adjunct to a beta-blocker
  ▶ TO THE EYE
  ▶ Child: Apply twice daily

● UNLICENSED USE Not licensed for use in children.
● CONTRA-INDICATIONS Hyperchloroemic acidosis
● CAUTIONS Chronic corneal defects - history of intra-ocular surgery - history of renal calculi - immature renal tubules (neonates and infants) - risk of metabolic acidosis - low endothelial cell count - systemic absorption follows topical application
● INTERACTIONS → Appendix 1: dorzolamide
● SIDE-EFFECTS
  ▶ Common or very common Asthenia - bitter taste - blurred vision - conjunctivitis - eyelid inflammation - headache - lacrimation - nausea - ocular irritation - superficial punctate keratitis
  ▶ Rare Contact dermatitis - corneal oedema - dizziness - dry mouth - epistaxis - eyelid crusting - paraesthesia - Stevens-Johnson syndrome - throat irritation - toxic epidermal necrolysis - transient myopia - urolithiasis
  ▶ Frequency not known Metabolic acidosis

SIDE-EFFECTS, FURTHER INFORMATION Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

● ALLERGY AND CROSS-SENSITIVITY Contra-indicated if history of sulfonamide hypersensitivity.
● PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
● BREAST FEEDING Manufacturer advises avoid—no information available.
● HEPATIC IMPAIRMENT Manufacturer advises caution—no information available.
● RENAL IMPAIRMENT Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● PRESCRIBING AND DISPENSING INFORMATION Although multi-dose dorzolamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride
  ▶ Azopt (Alcon Laboratories (UK) Ltd)
Azopt 10mg/ml eye drops | 5 ml £6.92 DT price = £2.11

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Eye drops
EXCIPIENTS: May contain Benzalkonium chloride
  ▶ Azopt (Alcon Laboratories (UK) Ltd)
Azopt 10mg/ml eye drops | 5 ml £6.92 DT price = £2.11

● CONTRA-INDICATIONS
Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

● INTERACTIONS
Appendix 1: dorzolamide

● SIDE-EFFECTS
  ▶ Common or very common
  ▶ Rare

● ALLERGY AND CROSS-SENSITIVITY
Contra-indicated if history of sulfonamide hypersensitivity.

● PREGNANCY
Manufacturer advises avoid—toxicity in animal studies.

● BREAST FEEDING
Manufacturer advises avoid—no information available.

● HEPATIC IMPAIRMENT
Manufacturer advises caution—no information available.

● RENAL IMPAIRMENT
Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● PRESCRIBING AND DISPENSING INFORMATION
Although multi-dose dorzolamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Dorzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, dorzolamide p. 656, timolol maleate p. 654.

INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma when beta-blockers alone not adequate Raised intra-ocular pressure in pseudo-exfoliative glaucoma when beta-blockers alone not adequate

▶ TO THE EYE
▶ Child: Apply twice daily

PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose dorzolamide with timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ Dorzolamide with timolol (Non-proprietary)
  
  Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml Dorzolamide 2% / Timolol 0.5% eye drops | 5 ml $27.16 DT price = £1.81
  
  Dorzolamide 2% / Timolol 0.5% eye drops 0.2ml unit dose preservative free | 60 unit dose $28.59 DT price = £28.59

▶ Cosopt (Santen UK Ltd)
  
  Timolol (as Timolol maleate) 5 mg per 1 ml, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml Cosopt eye drops 0.2ml unit dose preservative free | 60 unit dose $28.59 DT price = £28.59

Cosopt eye drops | 5 ml $10.05 DT price = £1.81

Pilocarpine

DRUG ACTION

Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

INDICATIONS AND DOSE

Raised intra-ocular pressure

▶ TO THE EYE
▶ Child 1 month-1 year: Apply 1 drop 3 times a day, doses are for 0.5% or 1% solution
▶ Child 2-17 years: Apply 1 drop 4 times a day

Pre- and postoperatively in goniectomy and trabeculotomy

▶ TO THE EYE
▶ Child: Apply once daily, 1% or 2% solution to be applied

UNLICENSED USE

Not licensed for use in children.

CONTRA-INDICATIONS

Acute inflammatory disease of the anterior segment - acute iritis - anterior uveitis - conditions where pupillary constriction is undesirable - some forms of secondary glaucoma (where pupillary constriction is undesirable)

CAUTIONS

A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage - asthma - cardiac disease - care in conjunctival damage - care in corneal damage - epilepsy - gastrointestinal spasm - hypertension - hyperthyroidism - hypotension - peptic ulceration - retinal detachment has occurred in susceptible individuals and those with retinal disease - urinary-tract obstruction

INTERACTIONS

▶ Appendix 1: pilocarpine

SIDE-EFFECTS

▶ Rare Parasympathomimetics systemic side effects

FREQUENCY NOT KNOWN

Blurred vision - ciliary spasm (leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment—a particular disadvantage in patients under 40 years of age) - conjunctival vascular congestion - lens changes (with chronic use) - myopia - ocular burning - ocular itching - pupillary block - smarting - vitreous haemorrhage

PREGNANCY

Avoid unless the potential benefit outweighs risk—limited information available.

BREAST FEEDING

Avoid unless the potential benefit outweighs risk—no information available.

PRE-TREATMENT SCREENING

Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).

MONITORING REQUIREMENTS

Intra–ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.

PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

▶ Pilocarpine (Non-proprietary)
  
  Pilocarpine hydrochloride 10 mg per 1 ml Pilocarpine hydrochloride 1% eye drops | 10 ml $16.10 DT price = £13.44
  
  Pilocarpine hydrochloride 20 mg per 1 ml Pilocarpine hydrochloride 2% eye drops | 10 ml $19.71 DT price = £16.48
  
  Pilocarpine hydrochloride 40 mg per 1 ml Pilocarpine hydrochloride 4% eye drops | 10 ml $21.99 DT price = £18.35

▶ Pilocarpine nitrate (Bausch & Lomb UK Ltd)
  
  Pilocarpine nitrate 20 mg per 1 ml Minims pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose $11.99

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

Latanoprost

INDICATIONS AND DOSE

Reduction of intra-ocular pressure in raised intra-ocular pressure and glaucoma

▶ TO THE EYE
▶ Child: Apply once daily, to be administered preferably in the evening

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015)

Following reformulation of Xalatan®, to allow for long-term storage at room temperature, there has been an increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.
**CONTRA-INDICATIONS** Active herpes simplex keratitis - history of recurrent herpetic keratitis associated with prostaglandin analogues

**CAUTIONS** Aphakia - asthma - children less than 1 year— limited information available - history of herpetic keratitis - history of significant ocular viral infections - peri-operative period of cataract surgery - preterm neonates less than 36 weeks gestational age—no information available - pseudophakia with torn posterior lens capsule or anterior chamber lenses - risk factors for cystoid macular oedema - risk factors for iritis - risk factors for uveitis

**SIDE-EFFECTS**
- **Common or very common** Blepharitis - conjunctival hyperaemia - eye irritation - eye pain - eyelash and vellus hair changes - increased iris pigmentation - transient punctate epithelial erosion
- **Uncommon** Blurred vision - conjunctivitis - dry eye - eyelid oedema - keratitis - skin rash
- **Rare** Corneal erosion - corneal oedema - distichiasis - iritis - macular oedema - misdirected eyelashes - periorbital oedema - photophobia - uveitis
- **Very rare** Chest pain - darkening of palpebral skin of the eyelids - localised skin reaction on the eyelids - periorbital changes resulting in deepening of the eyelid sulcus
- **Frequency not known** Arthralgia - asthma - dizziness - dyspnoea - exacerbation of asthma - headache - herpetic keratitis - iris cyst - myalgia - nasopharyngitis - palpititation - pyrexia
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** May be present in milk—manufacturer advises avoid.
- **MONITORING REQUIREMENTS** Monitor for changes to eye coloration.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE** Changes in eye colour. Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**NATIONAL FUNDING/ACCESS DECISIONS**

**MONOPOST**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (June 2013) that Monopost® is accepted for restricted use within NHS Scotland for the reduction of elevated intra-ocular pressure in patients with open-angle glaucoma and ocular hypertension who have proven sensitivity to benzalkonium chloride.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**EXCIPIENTS:** May contain Benzalkonium chloride

- **Latanoprost (Non-proprietary)**
  - Latanoprost 50 microgram per 1 ml: £12.48 DT price = £1.40
  - Monopost (Thea Pharmaceuticals Ltd)
  - Latanoprost 50 microgram per 1 ml: £8.49 DT price = £0.89
  - Xalatan (Pfizer Ltd)
  - Latanoprost 50 microgram per 1 ml: £12.48 DT price = £1.40

**SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS**

**Apraclonidine**

**DRUG ACTION** Apraclonidine is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

**INDICATIONS AND DOSE**

Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

- **TO THE EYE**
  - Child: Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

**Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug**

- **TO THE EYE**
  - Child 12-17 years: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

**UNLICENSED USE** 0.5% drops are not licensed for use in children under 12 years. 1% drops are not licensed for use in children.

**CONTRA-INDICATIONS** History of severe or unstable and uncontrolled cardiovascular disease

**CAUTIONS** Cerebrovascular disease - depression - heart failure - history of angina - hypertension - loss of effect may occur over time - Raynaud’s syndrome - recent myocardial infarction - reduction in vision in end-stage glaucoma (surgery treatment) - severe corneal insufficiency - thromboangiitis obliterans - vasovagal attack

**INTERACTIONS** → Appendix 1: apraclonidine

**SIDE-EFFECTS**

- **Common or very common** Conjunctivitis - dry eye - ocular intolerance - rhinitis - taste disturbance
- **Uncommon** Asthma - blepharitis - blepharospasm - chest pain - conjunctival vascular disorders - corneal erosion and infiltrates - dyspnoea - eyelid ptosis or retraction - impaired co-ordination - irritability - keratitis - keratopathy - myalgia - mydriasis - nervousness - parosmia - photophobia - rhinorrhea - throat irritation - visual impairment

**SIDE-EFFECTS, FURTHER INFORMATION**

- Ocular intolerance. Withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.
- Systemic effects. Since absorption may follow topical application, see clonidine hydrochloride p. 99.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.

**MONITORING REQUIREMENTS**

- Monitor intra-ocular pressure and visual fields.
- Monitor for excessive reduction in intra-ocular pressure following peri-operative use.

**PATIENT AND CARER ADVICE** Driving and skilled tasks. Drowsiness may affect performance of skilled tasks (e.g. driving).
6 Retinal disorders
6.1 Optic neuropathy

DRUGS FOR METABOLIC DISORDERS ▶
ANTIOXIDANTS

Idebenone

**DRUG ACTION**
Idebenone is a nootropic and antioxidant that is thought to act by restoring cellular ATP generation, thereby reactivating retinal ganglion cells.

**INDICATIONS AND DOSE**

- **Leber’s Hereditary Optic Neuropathy (initiated by a specialist)**
  - **BY MOUTH**
  - Child 12-17 years: 300 mg 3 times a day

**SIDE-EFFECTS**

- **Common or very common** Back pain · cough · diarrhoea · nasopharyngitis
- **Frequency not known** Anorexia · azotaemia · blood disorders · bronchitis · chromaturia · dyspepsia · hepatitis · malaise · nausea · nervous system disorders · pain in extremity · pruritus · raised lipids · raised liver enzymes · rash · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Chromaturia · The metabolites of idebenone may cause red-brown discoloration of the urine. This effect is harmless, but the manufacturer advises caution as this may mask colour changes due to other causes (e.g. renal or blood disorders).

**PREGNANCY**
Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**BREAST FEEDING**
Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
Manufacturer advises use with caution—no information available.

**RENAL IMPAIRMENT**
Manufacturer advises use with caution—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (May 2017) that idebenone (*Raxone®*) is accepted for restricted use within NHS Scotland for the treatment of visual impairment in patients with Leber’s Hereditary Optic Neuropathy (LHON) who are not yet blind i.e. they do not meet the UK criteria to be registered as severely sight impaired. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the lining of the ear canal usually associated with an underlying seborrhoeic dermatitis or eczema; it is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping.

A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with corticosteroid ear drops or with an astringent such as aluminium acetate solution p. 664. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

Secondary infection in otitis externa may be of bacterial, fungal, or viral origin. If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 662 or clioquinol) may be used, but for only about a week because excessive use may result in fungal infections that are difficult to treat. Sensitivity to the anti-infective or solvent may occur and resistance to antibiotics is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 662 may be used, but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating children when infection is present with inflammation and eczema. Clotrimazole1% solution p. 662 is used topically to treat fungal infection in otitis externa.

In view of reports of ototoxicity, manufacturers contra-indicate treatment with topical aminoglycosides or polymyxins in children with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in children with chronic supplicative otitis media and when other measures have failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (EarCalm® spray) is on sale to the public for children over 12 years.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 620 or ibuprofen p. 625, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, fusidic acid 2% (EarCalm® spray) is present in the external auditory meatus, fluclouxacillin p. 330 is the drug of choice; oral ciprofloxacin p. 333 or a systemic aminoglycoside may be needed for pseudomonal infections, particularly in children with diabetes or compromised immunity.

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments are then required, but prolonged use should be avoided.

Otitis media

Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in young children and may occur with even minor upper respiratory tract infections. Children diagnosed with acute otitis media should not be prescribed antibacterials routinely as many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a simple analgesic, such as paracetamol, may be sufficient. In children without systemic features, a systemic antibacterial may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the child is systemically unwell, if the

...
child is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in children with acute otitis media usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial can be given. Topical antibacterial treatment of acute otitis media is ineffective and there is no place for ear drops containing a local anaesthetic.

**Otitis media with effusion**

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Antimicrobials, corticosteroids, decongestants, and antihistamines have little place in the routine management of otitis media with effusion. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

**Chronic otitis media**

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in children with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction, which may completely resolve long-standing infection. Cleansing may be followed by topical treatment as for otitis externa; this is particularly beneficial for discharging ears or infections of the mastoid cavity. Acute exacerbations of chronic infection may require treatment with an oral antibacterial; a swab should be taken to identify infecting organisms and antibacterial sensitivity.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin p. 647 or ofloxacin eye drops p. 648 used in the ear [unlicensed use] or ear drops [both unlicensed; available from ‘special-order’ manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing aminoglycosides or polymyxins [unlicensed indications] cautiously in children with chronic supplicative otitis media and perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

**Removal of ear wax**

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the mental skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax causing discomfort or impaired hearing may be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops p. 664 are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The child should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Proprietary preparations containing organic solvents can irritate the mental skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 664 or urea hydrogen peroxide p. 665 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in children unable to cooperate with the procedure, in children who have had otitis media in the last six weeks, in otitis externa, in children with cleft palate, a history of ear drum perforation, or previous ear surgery. A child who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

**Administration**

To administer ear drops, lay the child down with the head turned to one side; for an infant pull the earlobe back and down, for an older child pull the earlobe back and up.

1 Otitis externa

**ANTI-BACTERIALS > AMINOGLYCOSIDES**

**Framycetin sulfate**

- **INDICATIONS AND DOSE**
  - Bacterial infection in otitis externa
    - TO THE EAR
    - Child: (consult product literature)

- **CONTRA-INDICATIONS**
  - Perforated tympanic membrane

- **CAUTIONS**

- **INDICATIONS AND DOSE**
  - **Acute otitis media in patients with tympanostomy tubes**
    - **TO THE EAR**
    - **Child 6 months–17 years**: Apply 4 drops twice daily for 7 days

  **Acute otitis externa**

  - **TO THE EAR**
  - **Child 1–17 years**: Apply 4 drops twice daily for 7 days

- **CONTRA-INDICATIONS**
  - Fungal ear infections · viral ear infections
  - **CAUTIONS**
    - Avoid prolonged use
  - **SIDE-EFFECTS**
    - Dizziness · skin exfoliation · viral ear infections
  - Eczematous inflammation in otitis externa

  **SIDE-EFFECTS FURTHER INFORMATION**

  - **Otorrhoea** Manufacturer advises further evaluation of underlying conditions if otorrhoea persists after a full course, or if at least two episodes of otorrhoea occur within 6 months.

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - Manufacturer advises caution—no information available.

- **PATIENT AND CARER ADVICE**
  - Manufacturer advises counselling on administration.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Ear drops**

  **EXCIPENTs**: May contain Benzalkonium chloride, disodium edetate

  Cilodex (Alcon Laboratories (UK) Ltd)

  *Dexamethasone 1 mg per 1 ml, Ciprofloxacin (as Ciprofloxacin hydrochloride) 3 mg per 1 ml* Cilodex ear drops | 5 ml (POM) £6.12 DT price = £6.12

Dexamethasone with framycetin sulfate and gramicidin

- **INDICATIONS AND DOSE**
  - **Eczematous inflammation in otitis externa**
    - **TO THE EAR**
    - **Child**: 2–3 drops 3–4 times a day
2 Removal of ear wax

BICARBONATE

Sodium bicarbonate

- **INDICATIONS AND DOSE**
  - Removal of ear wax (with 5% ear drop solution)
    - **TO THE EAR**
    - Child: (consult product literature)

- **SIDE-EFFECTS**
  - Dryness of the ear canal

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

**Ear drops**
- Sodium bicarbonate (Non-proprietary)
  - Sodium bicarbonate 50 mg per 1 ml
  - Sodium bicarbonate 5% ear drops | 10 ml £1.23–£1.25

SOFTENING DRUGS

Almond oil

- **INDICATIONS AND DOSE**
  - Removal of ear wax
    - **TO THE EAR**
    - Child: Allow drops to warm to room temperature before use (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION**
  - The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

**Liquid**
- Almond oil (Non-proprietary)
  - Almond oil 1 ml per 1 ml
  - Almond oil liquid | 50 ml £0.91 OT price = £0.91
  - 70 ml £0.73–£0.82
  - 200 ml £2.54
  - 500 ml £11.90

Arachis oil with chlorobutanol

- **INDICATIONS AND DOSE**
  - Removal of ear wax
    - **TO THE EAR**
    - Child 1-17 years: (consult product literature)

- **LESS SUITABLE FOR PRESCRIBING**
  - Arachis (peanut) oil with chlorobutanol ear drops are less suitable for prescribing.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

**Ear drops**
- Cerumol (Thornton & Ross Ltd)
  - Chlorobutanol 50 mg per 1 ml
  - Arachis oil 573 mg per 1 ml
  - Cerumol ear drops | 11 ml £2.05

Docusate sodium

- **INDICATIONS AND DOSE**
  - Removal of ear wax
    - **TO THE EAR**
    - Child 1-17 years: (consult product literature)

- **MEDICINAL FORMS**
  - Docusate sodium sulphosuccinate ear drops are less suitable for prescribing.

**Indications and dose**
- Removal of ear wax
- Children: Apply 1 spray 3 times a day

**Contra-indications**
- Patient grommet (although may be used by specialists, see Ear p. 660) • perforated tympanic membrane (although may be used by specialists, see Ear p. 660)

**Cautions**
- Avoid prolonged use

**Side-effects**
- Local sensitivity

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Spray**
- EXCPIENTS: May contain Hydroxybenzoates (parabens)
  - Otomizone (Teva UK Ltd)
    - Dexamethasone 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram
    - Acetic acid glacial 20 mg per 1 gram
    - Otomizone ear spray | 5 ml £3.27

**Astringents**

Aluminium acetate

- **INDICATIONS AND DOSE**
  - Inflammation in otitis externa
    - **TO THE EAR**
    - Child: To be inserted into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

- **Unlicensed use**
  - Not licensed for use in children.

- **DIRECTIONS FOR ADMINISTRATION**
  - For ear drops 8%—dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ear drops

- **Less suitable for prescribing**
  - Sofradex® is less suitable for prescribing.

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye drops solution**
- EXCPIENTS: May contain polysorbates
  - Sofradex (Sanofi)
    - Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasolfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml
    - Sofradex ear/eye drops | 10 ml £7.50

**Dexamethasone with glacial acetic acid and neomycin sulfate**

The properties listed below are those particular to the combination only. For the properties of the components please consider neomycin sulfate p. 662.

- **indications and dose**
  - Eczematous inflammation in otitis externa
    - **TO THE EAR**
    - Child 2-17 years: Apply 1 spray 3 times a day

- **Contra-indications**
  - Patent grommet (although may be used by specialists, see Ear p. 660) • perforated tympanic membrane (although may be used by specialists, see Ear p. 660)

- **Cautions**
  - Avoid prolonged use

- **Side-effects**
  - Local sensitivity

Nose

**Nose**

**Rhinitis and bacterial sinusitis**

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials. Many nasal preparations contain sympathomimetic drugs which can give rise to rebound congestion (rhinitis medicamentosa) and may damage the nasal cilia. Sodium chloride 0.9% solution p. 561 may be used as a douche or ‘sniff’ following endonasal surgery.

**Administration**

To administer nasal drops, lay the child face-upward with the neck extended, instil the drops, then sit the child up and tilt the head forward.

**Drugs used in nasal allergy**

Mild allergic rhinitis is controlled by antihistamines (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 165) or topical nasal corticosteroids; systemic nasal decongestants are not recommended for use in children. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms can be relieved by topical nasal corticosteroids; it can be used in children with seasonal allergic rhinitis (unresponsive to other treatments) and concomitant asthma.

Children with disabling symptoms of seasonal rhinitis (e.g. students taking important examinations), may be treated with oral corticosteroids for short periods. Oral corticosteroids may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal mucosa.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide p. 668 can reduce watery rhinorrhea.

**Corticosteroids**

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**Nasal polyps**

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the child in the ‘head down’ position. A short course of a systemic corticosteroid may be required initially to shrink
large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

**Pregnancy**

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 669, budesonide p. 669, fluticasone p. 670, or sodium cromoglicate may be considered.

**Topical nasal decongestants**

Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions in children with rhinitis. In infants, 1–2 drops of sodium chloride 0.9% solution in each nostril before feeds will help relieve congestion and allow more effective suckling.

Inhalation of **warm moist air** is useful in the treatment of symptoms of acute nasal congestion in infants and children, but the use of boiling water for steam inhalation is dangerous for children and should **not** be recommended. Volatile substances such as menthol and eucalyptus may encourage inhalation of warm moist air (see also Aromatic inhalations, cough preparations and systemic nasal decongestants p. 180).

Topical nasal decongestants containing sympathomimetics can cause rebound congestion (**rhinitis medicamentosa**) following prolonged use (more than 7 days), and are therefore of limited value in the treatment of nasal congestion.

Ephedrine hydrochloride nasal drops below is the least likely of the sympathomimetic nasal decongestants to cause rebound congestion and can provide relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline p. 667 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide.

Recurrent, persistent bleeding may respond to the use of a sympathomimetic nasal spray; if infection is present, chlorhexidine and neomycin (**Naseptin**®) cream may be effective.

**Sinusitis and oral pain**

Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air or with ephedrine hydrochloride nasal drops.

Systemic antibacterials may sometimes be required for sinusitis (see under Nose infections, bacterial p. 295).

**Nasal preparations for infection**

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; see elimination of nasal staphylococci. In children, acute complications such as peri orbital cellulitis require hospital treatment.

**Nasal staphylococci**

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (**Naseptin**®), but re-colonisation frequently occurs. Coagulase–positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 668 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant *Staphylococcus aureus* (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin–resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

For eradication of MRSA also consult local infection control policy. See also MRSA p. 345.

---

**1 Nasal congestion**

**SYMPATHOMIMETICS > VASOCONSTRICTOR**

**Ephedrine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Nasal congestion** | **Sinusitis affecting the maxillary antrum**
    - **BY INTRanasal ADMINISTRATION**
      - Child 12-17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops

**IMPORTANT SAFETY INFORMATION**

**CHM/MHRA ADVICE**

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for up to 5 days’ treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Avoid excessive or prolonged use • cardiovascular disease • diabetes mellitus • hypertension • hyperthyroidism
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS**
  - Common or very common Headache • nausea
  - Frequency not known After excessive use tolerance with diminished effect • cardiovascular effect • local irritation • rebound congestion
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
- **PRESCRIBING AND DISPENSING INFORMATION** For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Ephedrine nasal drops may be prescribed.
- **EXCEPTIONS TO LEGAL CATEGORY** Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: nasal drops
  - **Nasal drops**
    - Ephedrine hydrochloride (Non-proprietary)
      - Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops | 10 ml £1.87–£1.90 DT price = £1.87
      - Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml £1.91–£1.94 DT price = £1.91
Pseudoephedrine hydrochloride

**INDICATIONS AND DOSE**

Congestion of mucous membranes of upper respiratory tract

- **BY MOUTH**
  - Child 6–11 years: 30 mg 3–4 times a day
  - Child 12–17 years: 60 mg 3–4 times a day

**CAUTIONS**

- Diabetes - heart disease - hypertension - hyperthyroidism - raised intra-ocular pressure

**INTERACTIONS**

- Appendix 1: sympathomimetics, vasoconstrictor

**SIDE-EFFECTS**

- Common or very common: Anxiety - headache - hypertension - insomnia - nausea - restlessness - tachycardia - vomiting
- Rare: Hallucinations - rash
- Very rare: Angle-closure glaucoma
- Frequency not known: Urinary retention

**PREGNANCY**

Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.

**BREAST FEEDING**

May suppress lactation; avoid if lactation not well established or if milk production insuficient.

**HEPATIC IMPAIRMENT**

Manufacturer advises use with caution in severe impairment.

**RENAI IMPAIRMENT**

Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.

**LESS SUITABLE FOR PRESCRIBING**

Pseudoephedrine hydrochloride is less suitable for prescribing.

**EXCEPTIONS TO LEGAL CATEGORY**

Galpseud® and Sudafed® can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

- **Galpseud** (Thornton & Ross Ltd)
  - Pseudoephedrine hydrochloride 6 mg per 1 ml
- **Sudafed Non-Drowsy Decongestant (pseudoephedrine)** (McNeil Products Ltd)
  - Pseudoephedrine hydrochloride 6 mg per 1 ml

**Tablet**

- **Galpseud** (Thornton & Ross Ltd)
  - Pseudoephedrine hydrochloride 60 mg
- **Sudafed Non-Drowsy Decongestant (pseudoephedrine)** (McNeil Products Ltd)
  - Pseudoephedrine hydrochloride 60 mg

**IMPORTANT SAFETY INFORMATION**

Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

---

Xylometazoline hydrochloride

**DRUG ACTION**

Xylometazoline is a sympathomimetic.

**INDICATIONS AND DOSE**

Nasal congestion

- **BY INTRanasAL ADMINISTRATION USING NASAL DROPS**
  - Child 6–11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril
  - Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril

- **BY INTRanasAL ADMINISTRATION USING NASAL SPRAY**
  - Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

**CAUTIONS**

- Angle-closure glaucoma - avoid excessive or prolonged use - cardiovascular disease - diabetes mellitus - hypertension - hyperthyroidism - rebound congestion

**INTERACTIONS**

Appendix 1: sympathomimetics, vasoconstrictor

**SIDE-EFFECTS**

Cardiovascular effects - hallucinations in small children - headache - local irritation - nausea - rebound congestion - restlessness - sleep disturbances in small children - tolerance with diminished effect (after excessive use) - transient visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hallucinations (in small children) Discontinue treatment if the hallucinations occur.

**PREGNANCY**

Manufacturer advises avoid.

**BREAST FEEDING**

Manufacturer advises caution—no information available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **Otrivine** (GlaxoSmithKline Consumer Healthcare)

- **Sudafed Congestion Relief** (McNeil Products Ltd)
  - **Xylometazoline hydrochloride 1 mg per 1 ml**
    - Sudafed Congestion Relief 0.1% nasal spray | 10 ml GSK £3.25 DT price = £2.18
    - **Sudafed Mucus Relief** (McNeil Products Ltd)
      - **Xylometazoline hydrochloride 1 mg per 1 ml**
        - Sudafed Mucus Relief 0.1% nasal spray | 15 ml GSK £2.37
2 Nasal infection

ANTIBACTERIALS > AMINOGYCOSES

Chlorhexidine with neomycin

- **INDICATIONS AND DOSE**
  - **Eradication of nasal carriage of staphylococci**
    - **BY INTRANASAL ADMINISTRATION**
    - Child: Apply 4 times a day for 10 days
  - **Preventing nasal carriage of staphylococci**
    - **BY INTRANASAL ADMINISTRATION**
    - Child: Apply twice daily

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol)
  - **Nasepin** (Alliance Pharmaceuticals Ltd)
    - Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram
    - Nasepin nasal cream | 15 gram | £2.24 DT price = £2.24

Mupirocin

- **INDICATIONS AND DOSE**
  - **BACTROBAN NASAL**
    - For eradication of nasal carriage of staphylococci, including meticillin-resistant *Staphylococcus aureus* (MRSA)
      - **BY INTRANASAL ADMINISTRATION**
      - Child: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample positive (and throat not colonised), dose to be applied to the inner surface of each nostril

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING**
  - No information available.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Nasal ointment**
    - Bactroban (GlaxoSmithKline UK Ltd)
      - Mupirocin (as Mupirocin calcium) 20 mg per 1 gram
      - Bactroban 2% nasal ointment | 3 gram | £4.24 DT price = £4.24

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIONS

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 662, neomycin sulfate p. 662.

- **INDICATIONS AND DOSE**
  - **Nasal infection**
    - **BY INTRANASAL ADMINISTRATION USING NASAL DROPS**
    - Child: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

- **LESS SUITABLE FOR PRESCRIBING**
  - Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Ear/eye/nose drops solution**
    - EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
    - **Betnesol-N** (Focus Pharmaceuticals Ltd)
      - Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml
      - Betnesol-N ear/eye/nose drops | 10 ml | £2.39 DT price = £2.39

3 Nasal inflammation, nasal polyps and rhinitis

Other drugs used for Nasal inflammation, nasal polyps and rhinitis Desloratadine, p. 168 • Fexofenadine hydrochloride, p. 169 • Ketotifen, p. 174

ANTIMUSCARINICS

Ipratropium bromide

- **INDICATIONS AND DOSE**
  - **Rhinorrhea associated with allergic and non-allergic rhinitis**
    - **BY INTRANASAL ADMINISTRATION**
    - Child 12-17 years: 2 sprays 2–3 times a day, dose to be sprayed into each nostril

- **DOSE EQUIVALENT AND CONVERSION**
  - 1 metered spray of nasal spray = 21 micrograms.

- **CAUTIONS**
  - Avoid spraying near eyes • bladder outflow obstruction • cystic fibrosis • susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1: ipratropium

- **SIDE-EFFECTS**
  - Common or very common • Epistaxis • nasal dryness • nasal irritation
  - Uncommon • Headache • nausea
  - Very rare • Gastro-intestinal motility disturbances • palpitations • urinary retention

- **PREGNANCY**
  - Manufacturer advises only use if potential benefit outweighs the risk.

- **BREAST FEEDING**
  - No information available—manufacturer advises only use if potential benefit outweighs risk.
Corticosteroids (intranasal)

**CAUTIONS** Avoid after nasal surgery (until healing has occurred) - avoid in pulmonary tuberculosis - avoid in the presence of untreated nasal infections - patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

**CAUTIONS, FURTHER INFORMATION**
- Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

**SIDE-EFFECTS, FURTHER INFORMATION**
- Rare Glaucoma - raised intra-ocular pressure
- Very rare Nasal septal perforation (usually following nasal surgery)
- Frequency not known Aggression (particularly in children) - anxiety (particularly in children) - bronchospasm - depression (particularly in children) - dryness - epistaxis - headache - hyperactivity (particularly in children) - hypersensitivity reactions - nasal irritation - nasal ulceration - sleep disturbances (particularly in children) - smell disturbances - taste disturbances - throat irritation

**SIDE-EFFECTS, FURTHER INFORMATION**
- Systemic absorption Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

**MONITORING REQUIREMENTS** The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Beclometasone dipropionate

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of allergic and vasomotor rhinitis**
- **BY INTRANASAL ADMINISTRATION**
  - Child 6–17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, dose to be reduced when symptoms controlled; maximum 400 micrograms per day

**INTERACTIONS** → Appendix 1: corticosteroids

Betamethasone

**INDICATIONS AND DOSE**

**BETNESOL®**

Non-infected inflammatory conditions of nose
- **BY INTRANASAL ADMINISTRATION**
  - Child: Apply 2–3 drops 2–3 times a day, dose to be applied into each nostril

**VISTAMETHASONE®**

Non-infected inflammatory conditions of nose
- **BY INTRANASAL ADMINISTRATION**
  - Child: Apply 2–3 drops twice daily, dose to be applied into each nostril

**INTERACTIONS** → Appendix 1: corticosteroids

Budesonide

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of allergic and vasomotor rhinitis**
- **BY INTRANASAL ADMINISTRATION**
  - Child 12–17 years: Initially 200 micrograms once daily, dose to be administered into each nostril in the morning, alternatively initially 100 micrograms twice daily, dose to be administered to each nostril; reduced to 100 micrograms once daily, dose to be administered into each nostril, dose can be reduced when control achieved

**Nasal polyps**
- **BY INTRANASAL ADMINISTRATION**
  - Child 12–17 years: 100 micrograms twice daily for up to 3 months, dose to be administered into each nostril

**RHINOCORT AQUA®**

Rhinitis
- **BY INTRANASAL ADMINISTRATION**
  - Child 12–17 years: 128 micrograms once daily, dose to be administered into each nostril in the morning, alternatively 64 micrograms twice daily, dose to be administered into each nostril; reduced to continued
Fluticasone

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of allergic rhinitis and perennial rhinitis**

- **By intranasal administration using nasal spray**
- Child 4–11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
- Child 12–17 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved

**Nasal polyps**

- **By intranasal administration using nasal drops**
- Child 16–17 years: 200 micrograms 1–2 times a day, to be administered into each nostril, alternative treatment should be considered if no improvement after 4–6 weeks, (200 micrograms is equivalent to approximately 6 drops)

**AVAMYS® spray**

**Prophylaxis and treatment of allergic rhinitis**

- **By intranasal administration**
- Child 6–11 years: 27.5 micrograms once daily, dose to be sprayed into each nostril, then increased if necessary to 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose
- Child 12–17 years: 55 micrograms once daily, dose to be sprayed into each nostril, reduced to 27.5 micrograms once daily, to be sprayed into each nostril, dose to be reduced once control achieved; use minimum effective dose

**DOSE EQUIVALENCE AND CONVERSION**

- For Avamys® spray: 1 spray equivalent to 27.5 micrograms.

**INTERACTIONS** → Appendix 1: corticosteroids

**SIDE-EFFECTS** Nasal ulceration occurs commonly with nasal preparations containing fluticasone furoate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **EXCIPIENTS:** May contain Benzbromaron chloride, disodium edetate, polysorbates
- **Fluticasone (Non-proprietary)**
  - Fluticasone propionate 50 microgram per 1 dose Fluticasone propionate 50micrograms/dose nasal spray | 60 dose | no price available | 150 dose | no price available DT price = £11.01
  - **Avamys** (GlaxoSmithKline UK Ltd)
    - Fluticasone furoate 27.5 microgram per 1 dose Avamys 27.5micrograms/dose nasal spray | 120 dose | £6.44 DT price = £6.44
  - **Flixonase** (GlaxoSmithKline UK Ltd)
    - Fluticasone propionate 50 microgram per 1 dose Flixonase 50micrograms/dose aqueous nasal spray | 150 dose | £11.01 DT price = £11.01
  - **Nasofan** (Teva UK Ltd)
    - Fluticasone propionate 50 microgram per 1 dose Nasofan 50micrograms/dose aqueous nasal spray | 150 dose | £8.04 DT price = £11.01

**Nasal drops**

- **EXCIPIENTS:** May contain Polysorbates
- **Flixonase** (GlaxoSmithKline UK Ltd)
  - Fluticasone propionate 400 microgram Flixonase Nasule 400microgram/unit dose nasal drops | 28 unit dose | £12.99 DT price = £12.99

Fluticasone with azelastine

The properties listed below are those particular to the combination only. For the properties of the components please consider fluticasone above.

**INDICATIONS AND DOSE**

**Moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate**

- **By intranasal administration**
- Child 12–17 years: 1 spray twice daily, dose to be administered into each nostril

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **EXCIPIENTS:** May contain Benzbromaron chloride, polysorbates
- **Fluticasone with azelastine (Non-proprietary)**
  - Fluticasone propionate 50 microgram per 1 actuation, Azelastine hydrochloride 137 microgram per 1 actuation Fluticasone propionate 50micrograms/dose / Azelastine 137micrograms/dose nasal spray | 120 dose | no price available DT price = £14.80
  - **Dymista** (Meda Pharmaceuticals Ltd)
    - Fluticasone propionate 50 microgram per 1 actuation, Azelastine hydrochloride 137 microgram per 1 actuation Dymista 137micrograms/dose / 50micrograms/dose nasal spray | 120 dose | £14.80 DT price = £14.80

Mometasone furoate

**INDICATIONS AND DOSE**

**Prophylaxis and treatment of allergic rhinitis**

- **By intranasal administration**
- Child 6–11 years: 50 micrograms daily, dose to be sprayed into each nostril
- Child 12–17 years: 100 micrograms daily, increased if necessary up to 200 micrograms daily, dose to be sprayed into each nostril; reduced to 50 micrograms daily, dose to be reduced when control achieved, dose to be sprayed into each nostril

**INTERACTIONS** → Appendix 1: corticosteroids
Dry mouth 671

Oropharynx

1 Dry mouth

Treatment of dry mouth

Overview
Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics and sedating antihistamines), by irradiation of the head and neck region or by damage to or disease of the salivary glands. Children with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop dental caries, periodontal disease, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate.

Artificial saliva products

Artificial saliva products

AS SALIVA ORTHANA® LOZENGES
Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral

INDICATIONS AND DOSE
Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

BY MOUTH
Child: 1 lozenge as required, allow to dissolve slowly in the mouth

PRESCRIBING AND DISPENSING INFORMATION
AS Saliva Orthana® lozenges do not contain fluoride.

AS Saliva Orthana® lozenges (A S Pharma Ltd)
30 lozenges (ACBS) | NHS indicative price = £3.50

AS SALIVA ORTHANA® SPRAY
Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

INDICATIONS AND DOSE
Symptomatic treatment of dry mouth

BY MOUTH
Child: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary
AS Saliva Orthana® Oral Spray may be prescribed.
### BIOXTRA® GEL
Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

#### INDICATIONS AND DOSE
- **Dry mouth as a result of having (or having undergone) radiotherapy (ACBS)** | **Dry mouth as a result of sicca syndrome (ACBS)**
  - **By mouth**
  - **Child**: Apply as required, to oral mucosa

#### PROFESSION SPECIFIC INFORMATION
- **Dental practitioners’ formulary**
  - *BioXtra®* GEL may be prescribed.
  - *BioXtra Dry Mouth oral gel* (R.I.S. Products Ltd)
    - 40 ml - NHS indicative price = £3.94 • Drug Tariff (Part IXa)

### BIOTENE ORALBALANCE®
Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

#### INDICATIONS AND DOSE
- **Symptomatic treatment of dry mouth**
  - **By mouth**
  - **Child**: Apply as required, apply to gums and tongue

#### PATIENT AND CARER ADVICE
Avoid use with toothpastes containing detergents (including foaming agents).

#### PROFESSION SPECIFIC INFORMATION
- **Dental practitioners’ formulary**
  - *Biotene Oralbalance® Saliva Replacement Gel* may be prescribed as Artificial Saliva Gel.
  - *Biotene Oralbalance dry mouth saliva replacement gel* (GlaxoSmithKline Consumer Healthcare)
    - Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg 50 gram - NHS indicative price = £4.46 • Drug Tariff (Part IXa)
  
### GLANDOSANE®
Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

#### INDICATIONS AND DOSE
- **Dry mouth as a result of having (or having undergone) radiotherapy (ACBS)** | **Dry mouth as a result of sicca syndrome (ACBS)**
  - **By mouth**
  - **Child**: Apply as required, spray onto oral and pharyngeal mucosa

#### PROFESSION SPECIFIC INFORMATION
- **Dental practitioners’ formulary**
  - *Glandosane® Aerosol Spray* may be prescribed.
    - *Glandosane synthetic saliva spray lemon* (Fresenius Kabi Ltd)
      - 50 ml - NHS indicative price = £5.68
    - *Glandosane synthetic saliva spray natural* (Fresenius Kabi Ltd)
      - 50 ml - NHS indicative price = £5.68
    - *Glandosane synthetic saliva spray peppermint* (Fresenius Kabi Ltd)
      - 50 ml - NHS indicative price = £5.68

### ORALIEVE GEL
Symptomatic treatment of dry mouth

#### INDICATIONS AND DOSE
- **By mouth**
  - **Child**: Apply as required, particularly at night, to oral mucosa

#### PRESCRIBING AND DISPENSING INFORMATION
Contains traces of milk protein and egg white protein.

### SST®
Sugar-free, citric acid, malic acid and other ingredients in a sorbitol base.

#### INDICATIONS AND DOSE
- **Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts**
  - **By mouth**
  - **Child**: 1 tablet as required, allow tablet to dissolve slowly in the mouth

#### PROFESSION SPECIFIC INFORMATION
- **Dental practitioners’ formulary**
  - May be prescribed as Saliva Stimulating Tablets.
  - *SST saliva stimulating tablets* (Sinclair IS Pharma Plc)
    - 100 tablet - NHS indicative price = £4.86 • Drug Tariff (Part IXa)

### SALIVEZE®
Carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral

#### INDICATIONS AND DOSE
- **Dry mouth as a result of having (or having undergone) radiotherapy (ACBS)** | **Dry mouth as a result of sicca syndrome (ACBS)**
  - **By mouth**
  - **Child**: Apply 1 spray as required, spray onto oral mucosa

#### PROFESSION SPECIFIC INFORMATION
- **Dental practitioners’ formulary**
  - *Saliveze® Oral Spray* may be prescribed.
  - *Saliveze mouth spray* (Wyvern Medical Ltd)
    - 50 ml(ACBS) • NHS indicative price = £3.95

### SALIVIX®
Sugar-free, reddish-amber, acacia, malic acid and other ingredients.

#### INDICATIONS AND DOSE
- **Symptomatic treatment of dry mouth**
  - **By mouth using pastilles**
  - **Child**: 1 unit as required, suck pastille

#### PROFESSION SPECIFIC INFORMATION
- **Dental practitioners’ formulary**
  - *Salivix® Pastilles* may be prescribed as Artificial Saliva Pastilles.
  - *Salivix pastilles* (Galen Ltd)
    - 50 pastille - NHS indicative price = £3.55 • Drug Tariff (Part IXa)

### XEROTIN®
Sugar-free, water, sorbitol, carmelllose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral

#### INDICATIONS AND DOSE
- **Symptomatic treatment of dry mouth**
  - **By mouth using pastilles**
  - **Child**: 1 spray as required

#### PROFESSION SPECIFIC INFORMATION
- **Dental practitioners’ formulary**
  - *Xerotonin® Oral Spray* may be prescribed as Artificial Saliva Oral Spray.
  - *Xerotonin spray* (SpePharm UK Ltd)
    - 100 ml • NHS indicative price = £6.86 • Drug Tariff (Part IXa)
2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays
There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes and gargles
Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. Mouthwashes may not be suitable for children under 7 years (risk of the solution being swallowed); the mouthwash or dental gel may be applied using a cotton bud.

A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 674 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 674, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris. Concentrations greater than 1.5% in children may cause ulceration and tissue damage.

Chlorhexidine below is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover, chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has an haemorrhagic disorder, or is disabled. Chlorhexidine mouthwash is used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in children undergoing dental procedures.
## Chlorhexidine with chlorobutanol

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 673.

### DIRECTIONS FOR ADMINISTRATION
Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water.

### PRESCRIBING AND DISPENSING INFORMATION
- No mouthwash preparations available—when prepared extemporaneously, the BP states Sodium Chloride
Mouthwash, Compound, BP consists of sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

### PROFESSION SPECIFIC INFORMATION

**Dental practitioners’ formulary**

Compound Sodium Chloride Mouthwash may be prescribed.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed preparations listed

## 2.1 Dental caries

### Fluoride

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months. Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess. Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

### VITAMINS AND TRACE ELEMENTS

#### Sodium fluoride

**INDICATIONS AND DOSE**

**Prophylaxis of dental caries for water content less than 300 micrograms/litre (0.3 parts per million) of fluoride ion**

- **BY MOUTH USING TABLETS**
  - Child 6 months–2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
  - Child 3–5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
  - Child 6–17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)

**Prophylaxis of dental caries for water content between 300 and 700 micrograms/litre (0.3–0.7 parts per million) of fluoride ion**

- **BY MOUTH USING TABLETS**
  - Child 3–5 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
  - Child 6–17 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)

**Prophylaxis of dental caries for water content above 700 micrograms/litre (0.7 parts per million) of fluoride ion**

- **Child 6 months–17 years:** Supplements not advised

**Prophylaxis of dental caries for individuals who are caries prone or medically compromised**

- **BY MOUTH USING MOUTHWASH**
  - Child 6–17 years: Rinse or gargle 10 mL daily

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE**

**Prophylaxis of dental caries**

- **BY MOUTH USING PASTE**
  - Child 10–17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE**

**Prophylaxis of dental caries**

- **BY MOUTH USING PASTE**
  - Child 16–17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

**EN-DE-KAY® FLUORINSE**

**Prophylaxis of dental caries for individuals who are caries prone or medically compromised**

- **BY MOUTH USING MOUTHWASH**
  - Child 8–17 years: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL

**DOSE EQUIVALENCE AND CONVERSION**

- Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.
- These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; **182**: 6–7).

#### CONTRA-INDICATIONS

Not for areas where drinking water is fluoridated.

#### SIDE-EFFECTS

- **Occasional** White flecks on teeth with recommended doses
- **Rare** Yellowish-brown discoloration if recommended doses are exceeded.

#### DIRECTIONS FOR ADMINISTRATION

Tablets should be sucked or dissolved in the mouth and taken preferably in the evening. For mouthwash, rinse mouth for 1 minute and then spit out.

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** Brush teeth for 1 minute before spitting out.

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** Brush teeth for 3 minutes before spitting out.

#### PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral tablet formulations may include orange.

#### PATIENT AND CARER ADVICE

- **Mouthwash** Avoid eating, drinking, or rinsing mouth for 15 minutes after use.
- **COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** Patients or carers should be given advice on how to administer sodium fluoride toothpaste. Avoid drinking or rinsing mouth for 30 minutes after use.
- **COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.

#### PROFESSION SPECIFIC INFORMATION

**Dental practitioners’ formulary**

Tablets may be prescribed as Sodium Fluoride Tablets. Oral drops may be prescribed as Sodium Fluoride Oral Drops.

Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.
Oral ulceration and inflammation

3 Oral ulceration and inflammation

Oral ulceration and inflammation

Ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy. It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Children with an unexplained mouth ulcer of more than 3 weeks’ duration require urgent referral to hospital to exclude oral cancer in adults or secondary causes such as leukaemia.

Simple mouthwashes

A saline mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes

Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of chlorhexidine mouthwash p. 673 is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids

Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ‘prodromal’ phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone oromucosal tablets p. 678 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclometasone dipropionate inhaler p. 154 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets p. 662 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 633) is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics

Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. When local anaesthetics are used in the mouth, care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Benzylamine hydrochloride p. 677 and flurbiprofen p. 678 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzylamine hydrochloride mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillectomy and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat in adolescents.

Choline salicylate p. 678 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration in adults and children over 16 years of age.

Other preparations

Doxycycline p. 679 rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis

Low-dose doxycycline (Periostat®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under
Oropharyngeal bacterial infections p. 679. See also Mouthwashes and other preparations for oropharyngeal use p. 673 for mouthwashes used for oral hygiene and plaque inhibition.

### ANAESTHETICS, LOCAL

#### Lidocaine hydrochloride
Lignocaine hydrochloride

- **INDICATIONS AND DOSE**
- **Dental practice**
  - Child: Rub gently into dry gum

[LaryngoJet®](#)

- **Anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract**
  - **TO MUCOUS MEMBRANES**
  - Child: Up to 3 mg/kg (max. per dose 200 mg), to be given as a single dose sprayed, instilled (if a cavity) or applied with a swab; reduce dose according to size, age, and condition of child

[Xylocaine®](#)

- **Bronchoscopy | Laryngoscopy | Oesophagoscopy | Endotracheal intubation**
  - **TO MUCOUS MEMBRANES**
  - Child: Up to 3 mg/kg

- **CAUTIONS** Can damage plastic cuffs of endotracheal tubes
- **INTERACTIONS** → Appendix 1: antiarrhythmics
- **SIDE-EFFECTS**
- **SIDE-EFFECTS, FURTHER INFORMATION** A single application of a topical lidocaine preparation does not generally cause systemic side-effects.

- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.

- **BREAST FEEDING** Present in milk but amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.

- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

- **PROFESSION SPECIFIC INFORMATION**

  - **Dental practitioners’ formulary**

  - **Lidocaine ointment 5% may be prescribed.**
  - **Spray may be prescribed as Lidocaine Spray 10%**

  - **Xylocaine®** May be prescribed as lidocaine spray 10%.

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug

  - **Spray**
    - Xylocaine (Aspen Pharma Trading Ltd)

#### Benzydamine hydrochloride

- **INDICATIONS AND DOSE**

  - **Painful inflammatory conditions of oropharynx**
    - **TO THE LESION USING MOUTHWASH**
      - Child 13–17 years: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
      - Child 1 month–5 years (body-weight 4–7 kg): 1 spray every 1.5–3 hours, to be administered onto the affected area
      - Child 1 month–5 years (body-weight 8–11 kg): 2 sprays every 1.5–3 hours, to be administered onto the affected area
      - Child 1 month–5 years (body-weight 12–15 kg): 3 sprays every 1.5–3 hours, to be administered onto the affected area
      - Child 1 month–5 years (body-weight 16 kg and above): 4 sprays every 1.5–3 hours, to be administered onto the affected area
      - Child 6–11 years: 4 sprays every 1.5–3 hours, to be administered onto affected area
      - Child 12–17 years: 4–8 sprays every 1.5–3 hours, to be administered onto affected area

  - **INDICATIONS AND DOSE**

  - **TO THE LESION USING OROMUCOSAL SPRAY**
    - Child 1 month–5 years (body-weight 4–7 kg): 1 spray every 1.5–3 hours, to be administered onto the affected area
    - Child 1 month–5 years (body-weight 8–11 kg): 2 sprays every 1.5–3 hours, to be administered onto the affected area
    - Child 1 month–5 years (body-weight 12–15 kg): 3 sprays every 1.5–3 hours, to be administered onto the affected area
    - Child 6–11 years: 4 sprays every 1.5–3 hours, to be administered onto affected area
    - Child 12–17 years: 4–8 sprays every 1.5–3 hours, to be administered onto affected area

- **INTERACTIONS** → Appendix 1: NSAIDs

- **SIDE-EFFECTS**

  - **Rare** Hypermucous conditions reactions

- **FREQUENCY NOT KNOWN** Occasional numbness or stinging

- **PROFESSION SPECIFIC INFORMATION**

  - **Dental practitioners’ formulary**

  - **Benzydamine Oromucosal Spray 0.15% may be prescribed.**
  - **Benzydamine mouthwash may be prescribed as Benzydamine Mouthwash 0.15%**.

- **MEDICINAL FORMS**

  - There can be variation in the licensing of different medicines containing the same drug.

  - **Spray**
    - Benzydamine hydrochloride (Non-proprietary)
      - Benzydamine hydrochloride 1.5 mg per 1 ml Benzydamine 0.15% oromucosal spray sugar-free | 30 ml £4.53 DT price = £4.10
    - Difflam (Meda Pharmaceuticals Ltd)
      - Benzydamine hydrochloride 1.5 mg per 1 ml Difflam 0.15% spray sugar-free | 30 ml £4.24 DT price = £4.10

  - **Mouthwash**
    - Benzydamine hydrochloride (Non-proprietary)
      - Benzydamine hydrochloride 1.5 mg per 1 ml Benzydamine 0.15% mouthwash sugar free sugar-free | 300 ml £7.14 DT price = £6.21
    - Difflam (Meda Pharmaceuticals Ltd)
      - Benzydamine hydrochloride 1.5 mg per 1 ml Difflam Oral Rinse 0.15% solution sugar-free | 300 ml £6.50 DT price = £6.21
      - Difflam 0.15% Sore Throat Rinse sugar-free | 200 ml £4.64
Flurbiprofen

- **INDICATIONS AND DOSE**
  - Relief of sore throat
    - By mouth using lozenges
    - Child 12–17 years: 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day

- **INTERACTIONS** → Appendix 1: NSAIDs
- **SIDE-EFFECTS** Mouth ulcers (move lozenge around mouth) • taste disturbance
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Lozenge**
      - Strefen (Reckitt Benckiser Healthcare (UK) Ltd)
      - Flurbiprofen 8.75 mg Strefen 8.75mg lozenges | 16 lozenges [£] £2.58 DT price = £2.58

CORTICOSTEROIDS

Betamethasone

- **INDICATIONS AND DOSE**
  - Oral ulceration
    - To the lesion using soluble tablets
    - Child 12–17 years: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed

- **UNLICENSED USE** Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.
- **CONTRA-INDICATIONS** Untreated local infection
- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Candidal infection • exacerbation of local infection
- **PATIENT AND CARER ADVICE** Patient counselling is advised for betamethasone soluble tablets (administration).
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Betamethasone Soluble Tablets 500 micrograms may be prescribed for oral ulceration.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Soluble tablet**
      - *CAUTIONARY AND ADVISORY LABELS* 10, 13, 21 (not for use as mouthwash for oral ulceration)
      - Betamethasone (Non-proprietary)
        - *Betamethasone (as Betamethasone sodium phosphate)*
          - 500 microgram Betamethasone 500microgram soluble tablets sugar free sugar-free | 100 tablet [Post] £42.60 DT price = £42.60

Hydrocortisone

- **INDICATIONS AND DOSE**
  - Oral and perioral lesions
    - To the lesion using buccal tablet
    - Child 1 month–11 years: Only on medical advice
    - Child 12–17 years: 1 lozenge 4 times a day, allowed to dissolve slowly in the mouth in contact with the ulcer

- **UNLICENSED USE** Hydrocortisone mucoadhesive buccal tablets licensed for use in children (under 12 years—on medical advice only).
- **CONTRA-INDICATIONS** Untreated local infection
- **INTERACTIONS** → Appendix 1: corticosteroids
- **SIDE-EFFECTS** Candidal infection • exacerbation of local infection
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Mucoadhesive buccal tablets may be prescribed as Hydrocortisone Oromucosal Tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Muco-adhesive buccal tablet**
      - Hydrocortisone (Non-proprietary)
        - Hydrocortisone (as Hydrocortisone sodium succinate) 2.5 mg Hydrocortisone 2.5mg muco-adhesive buccal tablets sugar free sugar-free | 20 tablet [P] £8.30 DT price = £7.30

SALICYLIC ACID AND DERIVATIVES

Choline salicylate

- **INDICATIONS AND DOSE**
  - Mild oral and perioral lesions
    - To the lesion
    - Child 16–17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

- **CONTRA-INDICATIONS** Children under 16 years
- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Rey’s syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Rey’s syndrome.
  - **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning
  - **INTERACTIONS** → Appendix 1: choline salicylate
  - **SIDE-EFFECTS** Transient local burning sensation
  - **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.
  - **PROFESSION SPECIFIC INFORMATION**
    - Dental practitioners’ formulary
      - Choline Salicylate Dental Gel may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Oromucosal gel**
      - Bonjela (Reckitt Benckiser Healthcare (UK) Ltd)
        - Choline salicylate 87 mg per 1 gram Bonjela Cool Mint gel sugar-free | 15 gram [GSL] £3.55 DT price = £2.58
        - Bonjela Original gel sugar-free | 15 gram [GSL] £2.58 DT price = £2.58

Salicylic acid with rhubarb extract

- **INDICATIONS AND DOSE**
  - Mild oral and perioral lesions
    - To the lesion
    - Child 16–17 years: Apply 3–4 times a day maximum duration 7 days

- **CONTRA-INDICATIONS** Children under 16 years
- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Rey’s syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be
used in children under 16 years, as a cautions measure due to the theoretical risk of Reye’s syndrome.

- **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning
- **SIDE-EFFECTS** Temporary discolouration of oral mucosa; temporary discolouration of teeth; transient local burning sensation
- **PATIENT AND CARER ADVICE** May cause temporary discolouration of teeth and oral mucosa.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Paint**
    - **EXCIPIENTS:** May contain Ethanol
    - Pyralvex (Meda Pharmaceuticals Ltd)
      - Salicylic acid 10 mg per 1 ml, Rhubarb extract 50 mg per 1 ml
      - Pyralvex solution | 10 ml £3.25

### 4 Oropharyngeal bacterial infections

#### Oropharyngeal bacterial infections

**Antibacterial therapy for pericoronitis**

Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

- Metronidazole p. 319, or alternatively, amoxicillin p. 325
  - Suggested duration of treatment 3 days or until symptoms resolve.

**Antibacterial therapy for gingivitis: acute necrotising ulcerative**

Antibacterial required only if systemic features of infection.

- Metronidazole, or alternatively, amoxicillin
  - Suggested duration of treatment 3 days or until symptoms resolve.

**Antibacterial therapy for periapical or periodontal abscess**

Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

- Amoxicillin, or alternatively, metronidazole
  - Suggested duration of treatment 5 days.

**Antibacterial therapy for periodontitis**

Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole, or alternatively in adults and children over 12 years, doxycycline below

**Antibacterial therapy for throat infections**

Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

- Phenoxymethylpenicillin p. 324
  - In severe infection, initial parenteral therapy with benzylpenicillin sodium p. 323, then oral therapy with phenoxymethylpenicillin or amoxicillin (or ampicillin p. 326). Avoid amoxicillin if possibility of glandular fever.
  - Suggested duration of treatment 10 days.

- If *penicillin-allergic*, clarithromycin p. 315 (or azithromycin p. 314 or erythromycin p. 316)
  - Suggested duration of treatment 10 days

#### ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

**Doxycycline**

- **INDICATIONS AND DOSE**
  - Treatment of recurrent aphthous ulceration
    - **BY MOUTH USING SOLUBLE TABLETS**
      - Child 12-17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed.

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CAUTIONS** Alcohol dependence
- **INTERACTIONS** Appendix 1: tetracyclines
- **SIDE-EFFECTS** Anorexia, anxiety, dry mouth, flushing, fungal superinfection (when used for periodontitis), tinnitus
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **PATIENT AND CARER ADVICE** Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
    - Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Dispersible tablet**
    - CAUTIONARY AND ADVISORY LABELS 6, 9, 11, 13
    - **Vibramycin-D** (Pfizer Ltd)
      - Doxycycline (as Doxycycline monohydrate) 100 mg
        - Vibramycin-D 100mg dispersible tablets sugar-free | 8 tablet | £4.91 DT price = £4.91

### 5 Oropharyngeal fungal infections

#### Oropharyngeal fungal infections

**Overview**

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

- **Thrush**
  - Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics, or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child’s teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 680 or miconazole p. 680 may be needed. Fluconazole p. 358 is effective for
unresponsive infections or if a topical antifungal drug cannot be used. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

**Acute erythematous candidiasis**
Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

**Angular cheilitis**
Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It may represent a nutritional deficiency or it may be related to oro-facial granulomatosis or HIV infection. Both yeasts (Candida spp.) and bacteria (Staphylococcus aureus and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream or fusidic acid ointment p. 342; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 714 can be used.

**Immunocompromised patients**
See advice on prevention of fungal infections under Immunocompromised children in Antifungals, systemic use p. 355.

Antiseptic mouthwashes can have a role in the prevention of oral candidiasis in immunocompromised children.

**Drugs used in oropharyngeal candidiasis**
Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is used by local application (as an oral gel) in the mouth but it is also absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. In neonates, nystatin oral suspension or miconazole oral gel is used for the treatment of oropharyngeal candidiasis; to prevent re-infection it is important to ensure that the mother’s breast nipples and the teats of feeding bottles are cleaned adequately.

Fluconazole given by mouth is reliably absorbed; it is used for infections that do not respond to topical therapy or when topical therapy cannot be used. Its use in neonates p. 360 can be used for fluconazole-resistant infections.

If candidal infection fails to respond after 1 to 2 weeks of treatment with antifungal drugs the child should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by re-infection from the genito-urinary or gastro-intestinal tract.

**Miconazole**

**INDICATIONS AND DOSE**

**Prevention and treatment of oral candidiasis**

- **BY MOUTH USING ORAL GEL**

  - Neonate: 1 mL 2–4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be smeared around the inside of the mouth after feeds.

  - Child 1 month–1 year: 1.25 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be smeared around the inside of the mouth after feeds.

  - Child 2–17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered

**Nystatin**

**INDICATIONS AND DOSE**

**Oral candidiasis**

- **BY MOUTH**

  - Neonate: 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved, to be given after feeds.

- **Child**: 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved.

**UNLICENSED USE**
Not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term.

**CONTRA-INDICATIONS**
Infants with impaired swallowing reflex

**CAUTIONS**
Avoid in acute porphyrias p. 577

**INTERACTIONS**
Appendix 1: antifungals, azoles

**SIDE-EFFECTS**
- Common or very common Nausea, rash, vomiting
- Very rare Diarrhoea (usually on long term treatment), hepatitis, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis

**PREGNANCY**
Manufacturer advises avoid if possible— toxicity at high doses in animal studies.

**BREAST FEEDING**
Manufacturer advises caution—no information available.

**HEPATIC IMPAIRMENT**
Avoid.

**DIRECTIONS FOR ADMINISTRATION**
Oral gel should be held around the inside of the mouth after feeds.

**ANTIFUNGALS**
IMIDAZOLE ANTIFUNGALS

**Oropharyngeal fungal infections**

**After meals, retain near oral lesions before swallowing (dental prostheses and other orthodontic appliances should be removed at night and brushed with gel)**

**Prevention and treatment of intestinal candidiasis**

- **BY MOUTH USING ORAL GEL**

  - Child 4 months–17 years: 5 mg/kg 4 times a day (max. per dose 250 mg 4 times a day) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared.

**UNLICENSED USE**
Not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term.

**CONTRA-INDICATIONS**
Infants with impaired swallowing reflex

**CAUTIONS**
Avoid in acute porphyrias p. 577

**INTERACTIONS**
Appendix 1: antifungals, azoles

**SIDE-EFFECTS**
- Common or very common Nausea, rash, vomiting
- Very rare Diarrhoea (usually on long term treatment), hepatitis, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis

**PREGNANCY**
Manufacturer advises avoid if possible— toxicity at high doses in animal studies.

**BREAST FEEDING**
Manufacturer advises caution—no information available.

**HEPATIC IMPAIRMENT**
Avoid.

**DIRECTIONS FOR ADMINISTRATION**
Oral gel should be held around the inside of the mouth after feeds.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral gel may include orange.

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how to administer miconazole oromucosal gel.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
Miconazole Oromucosal Gel may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**
15-g tube of oral gel can be sold to the public.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oromucosal gel**

**CAUTIONARY AND ADVISORY LABELS**

- **Daktarin** (McNeil Products Ltd, Janssen-Cilag Ltd)
  - **Miconazole 20 mg per 1 gram**
    - **Daktarin 20 mg/g oromucosal gel**
      - **sugar-free**
      - **15 gram**
      - **DT price = £3.23**
      - **sugar-free**
      - **80 gram**
      - **DT price = £4.38**

**ANTIFUNGALS**

**POLYENE ANTIFUNGALS**

**DIETARY CONSIDERATIONS**

- **Nystatin**

  - **INDICATIONS AND DOSE**

    - **Oral candidiasis**

      - **BY MOUTH**

        - Neonate: 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved, to be given after feeds.

        - Child: 100 000 units 4 times a day usually for 7 days, and continued for 48 hours after lesions have resolved.
Oropharyngeal viral infections

Management

Viral infections are the most common cause of a sore throat. It is usually a self-limiting condition which does not benefit from anti-infective treatment. Adequate analgesia may be all that is required.

Children with varicella–zoster infection often develop painful lesions in the mouth and throat. Benzydamine hydrochloride p. 677 may be used to provide local analgesia. Chlorhexidine mouthwash or gel p. 673 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In severe herpetic stomatitis systemic aciclovir p. 387 or valaciclovir p. 389 may be used for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used to prevent frequently recurring herpes simplex lesions of the mouth particularly when associated with the initiation of erythema multiforme. See the treatment of labial herpes simplex infections.
Skin conditions, management

Topical preparations
When prescribing topical preparations for the treatment of skin conditions in children, the site of application, the condition being treated, and the child’s (and carer’s) preference for a particular vehicle all need to be taken into consideration.

Vehicles
The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk.

The vehicle in topical preparations for the skin affects the degree of hydration, has a mild anti-inflammatory effect, and aids the penetration of the active drug. Therefore, the vehicle, as well as the active drug, should be chosen on the basis of their suitability for the child’s skin condition.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. Shake lotions (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution
The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

Suitable quantities for prescribing

| Suitable quantities of dermatological preparations to be prescribed for specific areas of the body |
|---|---|---|
| Area of body | Creams and Ointments | Lotions |
| Face | 15–30 g | 100 ml |
| Both hands | 25–50 g | 200 ml |
| Scalp | 50–100 g | 200 ml |
| Both arms or both legs | 100–200 g | 200 ml |
| Trunk | 400 g | 500 ml |
| Groins and genitalia | 15–25 g | 100 ml |

These amounts are usually suitable for children 12-18 years for twice daily application for 1 week; smaller quantities will be required for children under 12 years. These recommendations do not apply to corticosteroid preparations.
Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis). The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(2-Chloroallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulfite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

Neonates

Caution is required when prescribing topical preparations for neonates—their large body surface area in relation to body mass increases susceptibility to toxicity from systemic absorption of substances applied to the skin. Topical preparations containing potentially sensitising substances such as corticosteroids, aminoglycosides, iodine, and parasiticidal drugs should be avoided. Preparations containing alcohol should be avoided because they can dehydrate the skin, cause pain if applied to raw areas, and the alcohol can cause necrosis. In preterm neonates, the skin is more fragile and offers a poor barrier, especially in the first fortnight after birth. Preterm infants, especially if below 32 weeks corrected gestational age, may also require special measures to maintain skin hydration.

1 Dry and scaling skin disorders

Emollient and barrier preparations

Borderline substances

The preparations marked ‘ACBS’ are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed ‘ACBS’ will normally not be investigated.

Emollients

Emollients hydrate the skin, soften the skin, act as barrier to water and external irritants, and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis; they should be applied immediately after washing or bathing to maximise the effect of skin hydration. The choice of an appropriate emollient will depend on the severity of the condition, the child’s (or carer’s) preference, and the site of application. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as aqueous cream and emulsifying ointment can be used as soap substitutes for handwashing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Emollient bath and shower preparations

In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for older children are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for younger children reflect this.

MHRA/CHM update (April 2016): Fire risk with paraffin-based skin emollients on dressings and clothing

When patients are being treated with a paraffin–based emollient product that is covered by a dressing or clothing, there is a danger that smoking or using a naked flame could cause dressings or clothing to catch fire.

Patients should be advised not to smoke, use naked flames (or be near people who are smoking or using naked flames), or go near anything that may cause a fire while emollients are in contact with their medical dressings or clothing. Patients’ clothing and bedding should be changed regularly—preferably daily—because emollients soak into fabric and can become a fire hazard.

Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone p. 698, natural oils, and paraffins, to help protect the skin from abrasion and irritation; they are used to protect intact skin around stomas and pressure sores, and as a barrier against nappy rash. In neonates, barrier preparations which do not contain potentially sensitising excipients are preferred. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations with zinc oxide or titanium salts are used to aid healing of uninfected, excoriated skin.

Nappy rash (Dermatitis)

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 709 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids (see cautions). If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream p. 694 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.
Emollients

In the neonate, a preservative-free paraffin-based emollient hydrates the skin without affecting the normal skin flora; substances such as olive oil are also used. The development of blisters (epidermolysis bullosa) or ichthyosis may be alleviated by applying liquid and white soft paraffin ointment while awaiting dermatological investigation.

Dermatological drugs > Emollients

Barrier creams and ointments

- **Indications and dose**
  - For use as a barrier preparation
  - **To the skin**
  - Child: (consult product literature)

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **Excipients:** May contain wool fat and related substances including lanolin.
    - Barrier creams and ointments (Non-proprietary)
      - Cetostearyl alcohol 20 mg per gram, Zinc oxide 75 mg per 1 gram, Beeswax white 100 mg per 1 gram, Arachis oil 305 mg per 1 gram, Castor oil 500 mg per 1 gram, Zinc and Castor oil ointment | 100 gram (GSL) £1.45 | 500 gram (GSL) £4.99–£5.37 DT price = £5.37
    - Zinc and Castor oil cream | 100 gram (GSL) £1.45
  - Brands may include Metametan

- **Spray**
  - CAUTIONARY AND ADVISORY LABELS 15
  - **Excipients:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), wool fat and related substances including lanolin.
  - *Sprilon (J M Loveridge Ltd)*
    - Dimeticone 10.4 mg per 1 gram, Zinc oxide 125 mg per 1 gram
      - Sprilon aerosol spray | 115 gram (GSL) £8.90 DT price = £6.90

- **Cream**
  - **Excipients:** May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, fragrances, hydroxybenzoates (parabens), propylene glycol, wool fat and related substances including lanolin.
  - *Conotrane (LEO Pharma)*
    - Benzalkonium chloride 1 mg per 1 gram, Dimeticone 220 mg per 1 gram
      - Conotrane cream | 100 gram (GSL) £0.88 DT price = £0.88 | 500 gram (GSL) £3.51
  - *Drapolene (Omega Pharma Ltd)*
    - Benzalkonium chloride 100 microgram per 1 gram, Cetrimide 2 mg per 1 gram
      - Drapolene cream | 100 gram (GSL) £1.76 | 200 gram (GSL) £2.86 | 350 gram (GSL) £4.28
  - *Siopep (Derma UK Ltd)*
    - Cetrimide 3 mg per 1 gram, Dimeticone 1000 100 mg per 1 gram
      - Siopep cream | 50 gram (GSL) £4.65
  - *Sudocrem (Teva UK Ltd)*
    - Benzyl cinnamate 1.5 mg per 1 gram, Benzyl alcohol 3.9 mg per 1 gram, Benzyl benzoate 10.1 mg per 1 gram, Wool fat hydrate 40 mg per 1 gram, Zinc oxide 152.5 mg per 1 gram
      - Sudocrem antiseptic healing cream | 60 gram (GSL) £1.45 | 125 gram (GSL) £2.15 | 250 gram (GSL) £3.67 | 400 gram (GSL) £5.25

Dermatological Drugs > Barrier preparations

**Indications and dose**

**Dermol® 200 Shower Emollient**

- **Dry and pruritic skin conditions including eczema and dermatitis**
  - **To the skin**
  - Child: To be applied to the skin or used as a soap substitute.

**Dermol® 600® Bath Emollient**

- **Dry and pruritic skin conditions including eczema and dermatitis**
  - **To the skin**
  - Child 1–23 months: 5–15 mL/bath, not to be used undiluted.
  - Child 2–17 years: 15–30 mL/bath, not to be used undiluted.

**Dermol® Wash Emulsion**

- **Dry and pruritic skin conditions including eczema and ichthyosis**
  - **To the skin**
  - Child 1–23 months: 5–10 mL/bath, alternatively, to be rubbed into dry skin until absorbed.
  - Child 2–17 years: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed.

**Oilatum® Plus**

- **Topical treatment of eczema, including eczema at risk from infection**
  - **To the skin**
  - Child 6–11 months: 1 mL/bath, not to be used undiluted.
  - Child 1–17 years: 1–2 capfuls/bath, not to be used undiluted.

**Important safety information**

These preparations make skin and surfaces slippery—particular care is needed when bathing.

MHRA/CHM update (April 2016): Fire risk with paraffin-based skin emollients on dressings or clothing. See Emollient and barrier preparations p. 683.

**Directions for administration**

- Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**Prescribing and dispensing information**

Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Bath additive**

- CAUTIONARY AND ADVISORY LABELS 15
  - **Excipients:** May contain Acetylated lanolin alcohols, isopropyl palmitate, polysorbates.
**INDICATIONS AND DOSE**

**Endogenous and exogenous eczema** | **Xeroderma** | **Ichthyosis**

**TO THE SKIN**

Child 2–17 years: 20–30 mL/bath, alternatively apply to wet skin and rinse

**IMPORTANT SAFETY INFORMATION**

These preparations make skin and surfaces slippery—particular care is needed when bathing.

**DIRECTIONS FOR ADMINISTRATION**

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubes should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

- **DIRECTIONS FOR ADMINISTRATION**
  Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

### Spray

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), poloxamers

- Dermastist (Alliance Pharmaceuticals Ltd)
  - Dermastist 10% spray | 250 ml | £5.97

- Emolin (C D Medical Ltd)
  - Emolin aerosol spray | 150 ml | £4.00 | 240 ml | £6.39

### Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, disodium edetate, fragrances, hydroxybenzoates (parabens), polysorbates, propylene glycol, sorbic acid, lanolin

- Aquamax (Intrapharm Laboratories Ltd)
  - Aquamax cream | 100 gram | £1.89 | 500 gram | £3.99

- Aquamol (Thornton & Ross Ltd)
  - Aquamol cream | 50 gram | £1.22 | 500 gram | £6.40

---

**Ointment**

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), poloxamers

- Emollient creams and ointments, paraffin-containing (Non-proprietary)
  - Liquid paraffin 200 mg per 1 gram, Emulsifying wax 300 mg per 1 gram, White soft paraffin 500 mg per 1 gram
    - Emulsifying ointment | 100 gram | GRL no price available | 500 gram | PDR | no price available | DT price | £2.92 | 500 gram | GRL | £3.43 DT price | £2.92

- Liquid paraffin 500 mg per 1 gram, White soft paraffin 500 mg per 1 gram
  - White soft paraffin 50% | Liquid paraffin 50% ointment | 250 gram | £1.87 | 500 gram | £4.19 DT price | £4.57 | 500 gram | PDR | £4.57 DT price | £4.57

- Magnesium sulfate dried 5 mg per 1 gram, Phenoxethanol 10 mg per 1 gram, Wool alcohols ointment 500 mg per 1 gram
  - Hydrous ointment | 500 gram | GRL | £4.89 DT price | £4.89

- White soft paraffin 1 mg per 1 mg, White soft paraffin solid
  - 500 gram | GRL | £4.33 DT price | £3.23 | 4500 gram | GRL | £19.17–£29.07
**Emollients, urea-containing**

- **Drug action** Urea is a keratin softener and hydrating agent used in the treatment of dry, scaling conditions (including ichthyosis) and may be useful in elderly patients.

- **Indications and dose**

  **Aquadrate®**
  - **Dry, scaling, and itching skin**
  - **To the skin**
  - Child: Apply twice daily, to be applied thinly

  **Balneum® Cream**
  - **Dry skin conditions**
  - **To the skin**
  - Child: Apply twice daily

  **Balneum® Plus Cream**
  - **Dry, scaling, and itching skin**
  - **To the skin**
  - Child: Apply twice daily

  **Calmurid®**
  - **Dry, scaling, and itching skin**
  - **To the skin**
  - Child: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

- **Dermatronics Once Heel Balm®**
  - **Dry skin on soles of feet**
  - **To the skin**
  - Child 12–17 years: Apply once daily

  **E45® Itch Relief Cream**
  - **Dry, scaling, and itching skin**
  - **To the skin**
  - Child: Apply twice daily

  **Eucerin® Intensive Cream**
  - **Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**
  - **To the skin**
  - Child: Apply twice daily, to be applied thinly and rubbed into area

  **Eucerin® Intensive Lotion**
  - **Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**
  - **To the skin**
  - Child: Apply twice daily, to be applied sparingly and rubbed into area

  **Flexitol®**
  - **Dry skin on soles of feet and heels**
  - **To the skin**
  - Child 12–17 years: Apply 1–2 times a day

  **Hydromol® Intensive**
  - **Dry, scaling, and itching skin**
  - **To the skin**
  - Child: Apply twice daily, to be applied thinly

  **Imuder® Emollient**
  - **Dry skin conditions including eczema, psoriasis or dermatitis**
  - **To the skin**
  - Child: Apply to skin or use as a soap substitute

  **Nutraplus®**
  - **Dry, scaling, and itching skin**
  - **To the skin**
  - Child: Apply 2–3 times a day

- **Directions for administration** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

- **Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  - **Exipients**: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), isopropyl palmitate, polysorbates, propylene glycol, wool fat and related substances including lanolin
  - **Aquadrate®** (Alliance Pharmaceuticals Ltd)
    - Urea 100 mg cream
    - Balneum cream
  - **Balneum®** (Almirall Ltd)
    - Laueromacrols 30 mg per 1 gram
    - Balneum Plus cream
  - **Calmurid®** (Galderma UK Ltd)
    - Lactic acid 50 mg per 1 gram
  - **E45 Itch Relief** (Forum Health Products Ltd)
**2 Infections of the skin**

### Skin infections

#### Antibacterial preparations

Topical antibacterial preparations are used to treat localised bacterial skin infections caused by Gram-positive organisms (particularly staphylococci or streptococci). Systemic antibacterial treatment is more appropriate for deep-seated skin infections.

Problems associated with the use of topical antibacterials include bacterial resistance, contact sensitisation, and superinfection. In order to minimise the development of resistance, antibacterials used systemically (e.g. fusidic acid p. 342) should not generally be chosen for topical use. **Resistant organisms** are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Neomycin sulfate p. 692 applied topically may cause sensitisation and cross-sensitivity with other aminoglycoside antibacterials such as gentamicin p. 299 may occur. Topical antibacterials applied over large areas can cause systemic toxicity; ototoxicity with neomycin sulfate and with polymyxins p. 693 is a particular risk for neonates and children with renal impairment.

Superficial bacterial infection of the skin may be treated with a topical antiseptic such as povidone–iodine p. 731 which also softens crusts, or hydrogen peroxide 1% cream p. 733.

Bacterial infections such as impetigo and folliculitis can be treated with a short course of topical fusidic acid; mupirocin p. 694 should be used only to treat meticillin-resistant *Staphylococcus aureus*.

For extensive or long-standing impetigo, an oral antibacterial such as flucloxacillin p. 330 (or clarithromycin p. 315 in children with penicillin-allergy), should be used. A mild antiseptic may help to soften crusts. Mild antiseptics may be useful in reducing the spread of infection, but there is little evidence to support the use of topical antiseptics alone in the treatment of impetigo.

*Cellulitis*, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

*Staphylococcal scalded-skin syndrome* requires urgent treatment with a systemic antibacterial, such as flucloxacillin.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging, it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic, such as povidone–iodine, chlorhexidine p. 732, or alcohol, can be used; their use should be discussed with the local microbiologist.

Mupirocin ointment contains macrogols; extensive absorption of macrogols through the mucous membranes or through application to thin or damaged skin may result in renal toxicity, especially in neonates. Mupirocin nasal ointment is formulated in a paraffin base and may be more suitable for the treatment of MRSA-infected open wound in neonates.

Metronidazole gel p. 692 is used topically in children to reduce the odour associated with anaerobic infections and for the treatment of periorificial rosacea; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

Retapamulin p. 694 can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA.

Silver sulfadiazine p. 693 is licensed for the prevention and treatment of infection in burns but the use of appropriate dressings may be more effective. Systemic effects may occur following extensive application of silver sulfadiazine; its use is not recommended in neonates.

**Antibacterial preparations also used systemically**

Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 679 for further information on angular cheilitis.

Metronidazole is used topically to treat rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

**Antifungal preparations**

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Specimens of scale, nail or hair should be sent for mycological examination before starting treatment, unless the diagnosis is certain.

**Dermatophytooses**

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manusum), foot (tinea pedis, athlete’s foot), or nail (tinea unguium, onychomycosis). Tinea capitis is a common childhood infection that requires systemic treatment with an oral antifungal; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of
transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm.

Tinea corporis and tinea pedis infections in children respond to treatment with a topical **imidazole** (clotrimazole p. 694, econazole nitrate p. 695, or miconazole p. 695) or terbinafine cream p. 696. Nystatin p. 680 is less effective against *Candida*.

**Compound benzoic acid ointment** (Whittlefs ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations. Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic children with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of tioconazole p. 696 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy. Chronic paronychia on the fingers (usually due to a candidal infection) should be treated with topical clotrimazole or nystatin, but these preparations should be used with caution in children who suck their fingers. Chronic paronychia of the toes (usually due to dermatophyte infection) can be treated with topical terbinafine.

**Pityriasis versicolor**
Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo p. 695 or selenium sulfide shampoo. Topical imidazole antifungals such as clotrimazole, econazole nitrate, and miconazole or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with an azole antifungal. Relapse is common, especially in the immunocompromised.

**Candidiasis**
Candidal skin infections can be treated with topical imidazole antifungals clotrimazole p. 694, econazole nitrate p. 695, or miconazole p. 695; topical terbinafine p. 696 is an alternative. Topical application of nystatin p. 680 is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 358; systemic treatment with griseofulvin p. 363 or terbinafine is **not appropriate** for refractory candidiasis. See the treatment of oral candidiasis and for the management of nappy rash.

**Angular cheilitis**
Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*.

**Compound topical preparations**
Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 709) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of **intertriginous eczema** associated with candida.

**Antiviral preparations**
Aciclovir cream p. 699 is used for the treatment of initial and recurrent labial herpes simplex infections in children; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections or if cold sores recur frequently.

**Herpes labialis**
Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear. Peniclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

**Parasiticidal preparations**

<table>

</tr>
<tr>
<td>Scalp (head lice)</td>
</tr>
<tr>
<td>Body (scabies)</td>
</tr>
<tr>
<td>Body (crab lice)</td>
</tr>
</tbody>
</table>

These amounts are usually suitable for a child 12–17 years for single application.

**Scabies**
Permethrin p. 699 is used for the treatment of **scabies** (*Sarcoptes scabiei*); malathion p. 699 can be used if permethrin is inappropriate.

-Benzyl benzoate is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

-Ivermectin p. 367 (available from ‘special-order’ manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone.

**Application**
Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

**Itching**
The itch and eczema of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 723 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a **sedating antihistamine** at night may also be useful.

**Head lice**
Dimethicone p. 698 is effective against head lice (*Pediculus humanus capitis*) and acts on the surface of the organism. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is not recommended for use in children.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present.
Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated at the same time.

Wet combing methods
Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:
- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff
- Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Crab lice
Permethrin and malathion are used to eliminate crab lice (Pthirus pubis); permethrin is not licensed for treatment of crab lice in children under 18 years. An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

Parasitcidal preparations
Dimeticone coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days.

Malathion is recommended for scabies, head lice and crab lice. The risk of systemic effects associated with 1–2 applications of malathion p. 699 is considered to be very low; however, except in the treatment of hyperkeratotic scabies in children, applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be avoided since the likelihood of eradication of lice is not increased.

Permethrin p. 699 is effective for scabies. It is also active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice. Permethrin is also effective against crab lice but it is not licensed for this purpose in children under 18 years.

2.1 Bacterial skin infections

**ANTIBACTERIALS > AMINOGLYCOSIDES**

**Neomycin sulfate**

- **INDICATIONS AND DOSE**
  - **Bacterial skin infections**
    - **TO THE SKIN**
    - Child: Apply up to 3 times a day, for short-term use only
  
- **UNLICENSED USE** Neomycin Cream BPC—no information available.

- **CONTRA-INDICATIONS** Neonates
- **CAUTIONS**
  - **CAUTIONS, FURTHER INFORMATION**
    - **Large areas** If large areas of skin are being treated ototoxicity may be a hazard in children, particularly in those with renal impairment.
  - **INTERACTIONS** → Appendix 1: neomycin
  - **SIDE-EFFECTS** Sensitisation (cross sensitivity with other aminoglycosides may occur)
  - **RENAL IMPAIRMENT** Ototoxicity may be a hazard if large areas of skin are treated.
  - **LESS SUITABLE FOR PRESCRIBING** Neomycin sulfate cream is less suitable for prescribing.

**ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES**

**Metronidazole**

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

- **INDICATIONS AND DOSE**
  - **ACEA**
    - Acute inflammatory exacerbation of rosacea
      - **TO THE SKIN**
      - Child 1-17 years: Apply twice daily, to be applied thinly
  - **ANABACT**
    - Malodorous fungating tumours and malodorous gravitational and decubitus ulcers
      - **TO THE SKIN**
      - Child: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing
  - **METROGEL**
    - Acute inflammatory exacerbation of rosacea
      - **TO THE SKIN**
      - Child 1-17 years: Apply twice daily, to be applied thinly
    - Malodorous fungating tumours
      - **TO THE SKIN**
      - Child: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing
  - **METROSA**
    - Acute exacerbation of rosacea
      - **TO THE SKIN**
      - Child 1-17 years: Apply twice daily, to be applied thinly
  - **ROSICED**
    - Inflammatory papules and pustules of rosacea
      - **TO THE SKIN**
      - Child 1-17 years: Apply twice daily for 6 weeks (longer if necessary)
  - **ROZEX**
    - Inflammatory papules, pustules and erythema of rosacea
      - **TO THE SKIN**
      - Child 1-17 years: Apply twice daily
    - Inflammatory papules, pustules and erythema of rosacea
      - **TO THE SKIN**
      - Child 1-17 years: Apply twice daily
    - **ZYMET**
      - Acute inflammatory exacerbation of rosacea
        - **TO THE SKIN**
        - Child 1-17 years: Apply twice daily, to be applied thinly
ANTIBACTERIALS

Silver sulfadiazine

INDICATIONS AND DOSE

Prophylaxis and treatment of infection in burn wounds

TO THE SKIN

Child: Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries

TO THE SKIN

Child: Apply every 2–3 days, consult product literature for details

Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions

TO THE SKIN

Child: (consult product literature)

Adjunct to short-term treatment of infection in pressure sores

TO THE SKIN

Child: (consult product literature)

UNLICENSED USE

No age range specified by manufacturer.

CONTRA-INDICATIONS

Not recommended for neonates

CAUTIONS

G6PD deficiency

CAUTIONS, FURTHER INFORMATION

Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with side-effects and interactions as for sulfonamides if large areas of skin are treated.

INTERACTIONS

Appendix 1: silver sulfadiazine

SIDE-EFFECTS

Allergic reactions - argyria (following treatment of large areas of skin or prolonged use) - burning - itching - leucopenia - rashes

SIDE-EFFECTS, FURTHER INFORMATION

Severe blood and skin disorders. Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop.

Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients with sensitivity to sulfonamides.

PREGNANCY

Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

BREAST FEEDING

Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

HEPATIC IMPAIRMENT

Manufacturer advises caution if significant impairment.

RENAL IMPAIRMENT

Manufacturer advises caution if significant impairment.

MONITORING REQUIREMENTS

Monitor for leucopenia.

DIRECTIONS FOR ADMINISTRATION

Apply with sterile applicator.

UNLICENSED USE

No age range specified by manufacturer.

CONTRA-INDICATIONS

Not recommended for neonates

CAUTIONS

G6PD deficiency

CAUTIONS, FURTHER INFORMATION

Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with side-effects and interactions as for sulfonamides if large areas of skin are treated.

INTERACTIONS

Appendix 1: silver sulfadiazine

SIDE-EFFECTS

Allergic reactions - argyria (following treatment of large areas of skin or prolonged use) - burning - itching - leucopenia - rashes

SIDE-EFFECTS, FURTHER INFORMATION

Severe blood and skin disorders. Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop.

Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients with sensitivity to sulfonamides.

PREGNANCY

Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

BREAST FEEDING

Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

HEPATIC IMPAIRMENT

Manufacturer advises caution if significant impairment.

RENAL IMPAIRMENT

Manufacturer advises caution if significant impairment.

MONITORING REQUIREMENTS

Monitor for leucopenia.

DIRECTIONS FOR ADMINISTRATION

Apply with sterile applicator.
Retapamulin

- **INDICATIONS AND DOSE**  
  Superficial bacterial skin infection caused by *Staphylococcus aureus* and *Streptococcus pyogenes* (if resistant to first line topical antibacterials)
  - **TO THE SKIN**  
    - Child 9 months-17 years: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 2% of body surface area, review treatment if no response within 2–3 days

- **CONTRA-INDICATIONS**  
  Contact with eyes - contact with mucous membranes

- **SIDE-EFFECTS**  
  Contact dermatitis - localised erythema - localised irritation - localised pain - pruritus

- **NATIONAL FUNDING/ACCESS DECISIONS**  
  **Scottish Medicines Consortium (SMC) Decisions**  
  The Scottish Medicines Consortium has advised (March 2008) that retapamulin (Altargo®) is not recommended for use within NHS Scotland for the treatment of superficial skin infections.

- **MEDICINAL FORMS**  
  There can be variation in the licensing of different medicines containing the same drug.

  **Ointment**
  - **CAUTIONARY AND ADVISORY LABELS 28**
  - **EXCIPIENTS:** May contain Butylated hydroxytoluene
  - **Altargo** (GlaxoSmithKline UK Ltd)
    - Retapamulin 10 mg per 1 gram  
      Altargo 10mg/g ointment  
      5 gram [PSM] £7.89

2.2 Fungal skin infections

Other drugs used for Fungal skin infections  
Griseofulvin, p. 363

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

<table>
<thead>
<tr>
<th>Clotrimazole</th>
</tr>
</thead>
</table>

- **INDICATIONS AND DOSE**  
  Fungal skin infections  
  - **TO THE SKIN**  
    - Child: Apply 2–3 times a day

- **CAUTIONS**  
  Contact with eyes and mucous membranes should be avoided

- **INTERACTIONS**  
  - **Appendix 1: antifungals, azoles**

- **SIDE-EFFECTS**  
  Local irritation - erythema - hypersensitivity reactions - itching - mild burning sensation

- **SIDE-EFFECTS, FURTHER INFORMATION**  
  Treatment should be discontinued if side-effects are severe.

- **PREGNANCY**  
  Minimal absorption from skin; not known to be harmful.

- **PRESCRIBING AND DISPENSING INFORMATION**  
  Spray may be useful for application of clotrimazole to large or hairy areas of the skin.

- **MEDICINAL FORMS**  
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

  **Cream**
  - **EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

## Mupirocin

- **INDICATIONS AND DOSE**  
  Bacterial skin infections, particularly those caused by Gram-positive organisms (except pseudomonal infection)  
  - **TO THE SKIN**  
    - Child: Apply up to 3 times a day for up to 10 days

- **UNLICENSED USE**  
  Mupirocin ointment licensed for use in children (age range not specified by manufacturer).  
  Bactroban® cream not recommended for use in children under 1 year.

- **SIDE-EFFECTS**  
  Burning sensation - local reactions - pruritus - rash - urticaria

- **PREGNANCY**  
  Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING**  
  No information available.

- **RENAI IMPAIRMENT**  
  Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

- **MEDICINAL FORMS**  
  There can be variation in the licensing of different medicines containing the same drug.

  **Ointment**

      15 gram [PSM] £12.50 DT price = £5.26
    - Bactroban (GlaxoSmithKline UK Ltd)
      - Mupirocin 20 mg per 1 gram  
        Bactroban 2% ointment  
        15 gram [PSM] £5.26 DT price = £5.26

  **Cream**
  - **EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)
  - **Bactroban** (GlaxoSmithKline UK Ltd)
    - Mupirocin (as Mupirocin calcium) 20 mg per 1 gram  
      Bactroban 2% cream  
      15 gram [PSM] £5.26 DT price = £5.26
Econazole nitrate

**INDICATIONS AND DOSE**

**Fungal skin infections**
- TO THE SKIN
- Child: Apply twice daily

**Fungal nail infections**
- BY TRANSUNGUAL APPLICATION
- Child: Apply once daily, applied under occlusive dressing

**CAUTIONS**
Avoid contact with eyes and mucous membranes

**SIDE-EFFECTS**
- Burning sensation
- Erythema
- Hypersensitivity reactions
- Itching
- Occasional local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**
Treatment should be discontinued if side-effects are severe.

**PREGNANCY**
Minimal absorption from skin; not known to be harmful.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**
EXCIPIENTS: May contain Butylated hydroxyanisole, fragrances
- Gyno-Pevaryl (Janssen-Cilag Ltd)
- Econazole nitrate 10 mg per 1 gram Econazole nitrate 1% cream
  - 15 gram [Prop] £2.11
  - 30 gram [Prop] £3.78
- Pevaryl (Janssen-Cilag Ltd)
- Econazole nitrate 10 mg per 1 gram Pevaryl 1% cream
  - 30 gram [Prop] £3.71

**Prophylaxis of pityriasis versicolor**
- TO THE SKIN USING SHAMPOO
- Child 12–17 years: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing

**CAUTIONS**
Avoid contact with eyes - avoid contact with mucous membranes

**INTERACTIONS**
- Appendix 1: antifungals, azoles

**SIDE-EFFECTS**
- Erythema
- Hypersensitivity reactions
- Itching
- Mild burning sensation
- Occasional local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**
Treatment should be discontinued if side-effects are severe.

**EXCEPTIONS TO LEGAL CATEGORY**
Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole maximum 2%, in a pack containing maximum 120 mL and labelled to show a maximum frequency of application of once every 3 days.

**Miconazole**

**INDICATIONS AND DOSE**

**Fungal skin infections**
- TO THE SKIN
- Neonate: Apply twice daily continuing for 10 days after lesions have healed.

**Fungal nail infections**
- TO THE SKIN
- Child: Apply 1–2 times a day

**UNLICENSED USE**
Licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**
- Avoid in acute porphyrias p. 577 - contact with eyes and mucous membranes should be avoided

**INTERACTIONS**
- Appendix 1: antifungals, azoles

**SIDE-EFFECTS**
- Common or very common
  - Nausea
  - Rash
  - Vomiting

- Frequency not known
  - Burning sensation
  - Erythema
  - Hypersensitivity reactions
  - Itching
  - Occasional local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**
Treatment should be discontinued if side effects are severe.

**PREGNANCY**
Absorbed from the skin in small amounts; manufacturer advises caution.

**BREAST FEEDING**
Manufacturer advises caution — no information available.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
Miconazole cream may be prescribed.
Medications for the skin

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Cream
- Excipients: May contain Butylated hydroxianisole
- Daktarin (McNeil Products Ltd, Janssen-Cilag Ltd)
  - Miconazole nitrate 20 mg per 1 gram | 15 gram | £2.14
  - 30 gram | £1.82 DT price = £1.82
- Gyno-Daktarin (Janssen-Cilag Ltd)
  - Miconazole nitrate 20 mg per 1 gram | 78 gram | £4.33

Powder
- Daktarin (McNeil Products Ltd)
  - Miconazole nitrate 20 mg per 1 gram | 20 gram | £2.58 DT price = £2.58

Tioconazole

- **Indications and Dose**
  - Fungal nail infection
    - **By transungual application**
    - Child: Apply twice daily usually for up to 6 months (may be extended to 12 months), apply to nails and surrounding skin

- **Unlicensed use**
  - Licensed for use in children (age range not specified by manufacturer).

- **Caution**
  - Contact with eyes and mucous membranes should be avoided - use with caution if child likely to suck affected digits

- **Side-effects**
  - Burning sensation, dry skin, erythema, exfoliation, hypersensitivity reactions, itching, local oedema, nail discoloration, nail pain, occasional local irritation, periungual inflammation, rash

- **Side-effects, Further Information**
  - Treatment should be discontinued if side-effects are severe.

- **Pregnancy**
  - Manufacturer advises avoid.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Paint
    - **Tioconazole (Non-proprietary)**
      - Tioconazole 283 mg per 1 ml | 12 ml | £27.38–£28.74 DT price = £28.74
      - Trosyl (Pfizer Ltd)
        - Tioconazole 283 mg per 1 ml | 12 ml | £27.38 DT price = £26.74

- **Antifungals**

  - Amorolfine

    - **Indications and Dose**
      - Fungal nail infections
        - **By transungual Application**
        - Child 1 month-11 years: Apply 1–2 times a week for 6 months to treat finger nails and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
        - Child 12-17 years: Apply 1–2 times a week for 6 months to treat finger nails and for toe nails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes

    - **Unlicensed use**
      - Not licensed for use in children under 12 years.

  - **Caution**
    - Avoid contact with ears.

  - **Side-effects**
    - Burning sensation, erythema, hypersensitivity reactions, itching, occasional local irritation

  - **Side-effects, Further Information**
    - Treatment should be discontinued if side-effects are severe.

  - **Patient and Carer Advice**
    - Avoid nail varnish or artificial nails during treatment.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Medicated nail lacquer**
    - **Cautionary and Advisory Labels**
      - **Amorolfine (Non-proprietary)**
        - Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml | 3 ml | no price available
        - Loceryl (Galderma (UK) Ltd)
          - Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml | 2.5 ml | £7.26
          - 5 ml | £9.08 DT price = £6.99
      - **Omicur (Morningside Healthcare Ltd)**
        - Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml | 2.5 ml | £9.09
        - 5 ml | £9.09 DT price = £6.99

Terbinaine

- **Indications and Dose**
  - **Tinea pedis**
    - **By transungual application**
    - Child: Apply 1–2 times a day for up to 1 week, to be applied thinly
    - **By mouth using tablets**
    - Child 1-17 years (body-weight 10-19 kg): 62.5 mg once daily for 2–6 weeks
    - Child 1-17 years (body-weight 20-39 kg): 125 mg once daily for 2–6 weeks
    - Child 1-17 years (body-weight 40 kg and above): 250 mg once daily for 2–6 weeks

  - **Tinea corporis**
    - **By transungual application**
    - Child: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
    - **By mouth using tablets**
    - Child 1-17 years (body-weight 10-19 kg): 62.5 mg once daily for 4 weeks
    - Child 1-17 years (body-weight 20-39 kg): 125 mg once daily for 4 weeks
    - Child 1-17 years (body-weight 40 kg and above): 250 mg once daily for 4 weeks

  - **Tinea cruris**
    - **By transungual application**
    - Child: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks
    - **By mouth using tablets**
    - Child 1-17 years (body-weight 10-19 kg): 62.5 mg once daily for 2–4 weeks
    - Child 1-17 years (body-weight 20-39 kg): 125 mg once daily for 2–4 weeks
    - Child 1-17 years (body-weight 40 kg and above): 250 mg once daily for 2–4 weeks

  - **Tinea capitis**
    - **By mouth using tablets**
    - Child 1-17 years (body-weight 10-19 kg): 62.5 mg once daily for 4 weeks

Other antifungals

- **Tina container**
- **By transungual application**
- **Child 1 month-11 years:** Apply 1-2 times a week for 6 months to treat finger nails and for toe nails 9-12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes
- **Child 12-17 years:** Apply 1-2 times a week for 6 months to treat finger nails and for toe nails 9-12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes

- **Side-effects**
  - Burning sensation, erythema, hypersensitivity reactions, itching, occasional local irritation

- **Side-effects, Further Information**
  - Treatment should be discontinued if side-effects are severe.

- **Patient and Carer Advice**
  - Avoid nail varnish or artificial nails during treatment.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Medicated nail lacquer**
    - **Cautionary and Advisory Labels**
      - **Amorolfine (Non-proprietary)**
        - Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml | 3 ml | no price available
        - Loceryl (Galderma (UK) Ltd)
          - Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml | 2.5 ml | £7.26
          - 5 ml | £9.08 DT price = £6.99
      - **Omicur (Morningside Healthcare Ltd)**
        - Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml | 2.5 ml | £9.09
        - 5 ml | £9.09 DT price = £6.99
Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 4 weeks
Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 4 weeks

Dermatophyte infections of the nails
- **BY MOUTH USING TABLETS**
  - Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)
  - Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)
  - Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)

Cutaneous candidiasis | Pityriasis versicolor
- **TO THE SKIN USING CREAM**
  - Child: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS**
  - With oral use Autoimmune disease (risk of lupus-erythematosus-like effect) • psoriasis (risk of exacerbation)
  - With topical use Contact with eyes and mucous membranes should be avoided
- **INTERACTIONS** → Appendix 1: terbinafine
- **SIDE-EFFECTS**
  - **Common or very common**
    - With oral use Abdominal discomfort • anorexia • arthralgia • diarrhea • dyspepsia • headache • myalgia • nausea • rash • urticaria
  - **Uncommon**
    - With oral use Taste disturbance
  - **Rare**
    - With oral use Cholestasis • dizziness • hepatitis • hyponatraemia • jaundice • liver toxicity • malaise • paraesthesia
  - **Very rare**
    - With oral use Alopecia • blood disorders • lupus erythematosus-like effect • neutropenia • photosensitivity • serious skin reactions • Stevens-Johnson syndrome • thrombocytopaenia • toxic epidermal necrolysis
  - **Frequency not known**
    - With oral use Disturbances in smell • exacerbation of psoriasis • hearing disturbances • influenza-like symptoms • pancreatitis • rhombomylitis • vasculitis
    - With topical use Erythema • hypersensitivity reactions • itching • mild burning sensation • occasional local irritation
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Liver toxicity**
    - With oral use Discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).
    - With oral use Discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).
    - With oral use Discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).

- **PREGNANCY**
  - With topical use Manufacturer advises use only if potential benefit outweighs risk — animal studies suggest no adverse effects.
  - With oral use Manufacturer advises use only if potential benefit outweighs risk — no information available.
- **BREAST FEEDING**
  - With topical use Manufacturer advises avoid — present in milk. Less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother’s chest.
  - With oral use Avoid — present in milk.

- **HEPATIC IMPAIRMENT**
  - With oral use Manufacturer advises avoid — elimination reduced.
- **RENAL IMPAIRMENT**
  - With oral use Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m² and no suitable alternative available.
- **MONITORING REQUIREMENTS**
  - With oral use Monitor hepatic function before treatment and then every 4–6 weeks during treatment — discontinue if abnormalities in liver function tests.
- **EXCEPTIONS TO LEGAL CATEGORY**
  - Preparations of terbinafine hydrochloride (maximum 1%) can be sold to the public for use in those over 16 years for external use for the treatment of tinea pedis as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing maximum 30 mL spray or as a gel in a pack containing maximum 30 g gel.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

### Tablet

**CAUTIONARY AND ADVISORY LABELS** 9

- **Terbinafine (Non-proprietary)**
  - **Terbinafine (as Terbinafine hydrochloride) 250 mg**
    - Terbinafine 250 mg tablets | 14 tablet (Pom) £18.11 DT price = £1.21 | 28 tablet (Pom) £34.93
    - Lamisil (Novartis Pharmaceuticals Ltd)
  - **Terbinafine (as Terbinafine hydrochloride) 250 mg**
    - Lamisil 250 mg tablets | 14 tablet (Pom) £21.30 DT price = £1.21 | 28 tablet (Pom) £41.09

### Cream

**EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates.

- **Terbinafine (Non-proprietary)**
  - **Terbinafine hydrochloride 10 mg per 1 gram**
    - Terbinafine 1% cream | 7.5 gram (Pom) £1.06 | 15 gram (Pom) £3.17 DT price = £1.29 | 30 gram (Pom) £6.33 DT price = £2.58
    - Lamisil (GlaxoSmithKline Consumer Healthcare)
  - **Terbinafine hydrochloride 10 mg per 1 gram**
    - Lamisil 1% cream | 30 gram (Pom) £7.45 DT price = £2.58
    - Lamisil AT 1% cream | 7.5 gram (GSL) £2.39 | 15 gram (GSL) £3.60 DT price = £1.29

### ANTISEPTICS AND DISINFECTANTS ➔ UNDECENOATES

**Undecenoic acid with zinc undecenoate**

### **INDICATIONS AND DOSE**

**Treatment of athletes foot**
- **TO THE SKIN**
  - Child: Apply twice daily, continue use for 7 days after lesions have healed

**Prevention of athletes foot**
- **TO THE SKIN**
  - Child: Apply once daily

- **UNLICENSED USE** *Mycota®* licensed for use in children (age range not specified by manufacturer).
- **CAUTIONS**
  - Avoid broken skin • contact with eyes should be avoided • contact with mucous membranes should be avoided
- **SIDE-EFFECTS** Erythema • hypersensitivity reactions • itching • local irritation • mild burning sensation
SIDE-EFFECTS, FURTHER INFORMATION
Treatment should be discontinued if side effects are severe.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Cream
EXCIPIENTS: May contain Cetearyl alcohol (including cetyl and stearyl alcohol), fragrances
- Mycota (zinc undecenoate / undecenoic acid) (Thornton & Ross Ltd)
- Undecenoic acid 50 mg per 1 gram, Zinc undecenoate 200 mg per 1 gram Mycota cream | 25 gram £2.01

Powder
EXCIPIENTS: May contain Fragrances
- Mycota (zinc undecenoate / undecenoic acid) (Thornton & Ross Ltd)
- Undecenoic acid 20 mg per 1 gram, Zinc undecenoate 200 mg per 1 gram Mycota powder | 70 gram £2.94

ANTISEPTICS AND DISINFECTANTS

Chlorhexidine with nystatin

INDICATIONS AND DOSE
Skin infections due to Candida spp.
- TO THE SKIN
- Child: Apply 2–3 times a day, continuing for 7 days after lesions have healed

UNLICENSED USE
Licensed for use in children (age range not specified by manufacturer).

CAUTIONS
Avoid contact with eyes and mucous membranes

SIDE-EFFECTS
Burningsensation · erythema · hypersensitivity reactions · itching · occasional local irritation

SIDE-EFFECTS, FURTHER INFORMATION
Treatment should be discontinued if side-effects are severe.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Cream
EXCIPIENTS: May contain Benzyl alcohol, Cetearyl alcohol (including cetyl and stearyl alcohol), polycarbates
- Chlorhexidine with nystatin (Non-proprietary)
  Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100 000 unit per 1 gram Nystatin 100 000 units/g / Chlorhexidine hydrochloride 1% cream | 30 gram £4.99 DT price = £2.62
- Nystaform (Typharm Ltd)
  Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100 000 unit per 1 gram Nystaform cream | 30 gram £4.99 DT price = £2.62

BENZOATES

Benzoic acid with salicylic acid

INDICATIONS AND DOSE
Ringworm (tinea)
- TO THE SKIN
- Child: Apply twice daily

UNLICENSED USE
Licensed for use in children (age range not specified by manufacturer).

CAUTIONS
Avoid broken or inflamed skin · avoid contact with eyes · avoid contact with mucous membranes

CAUTIONS, FURTHER INFORMATION
- Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin.

SIDE-EFFECTS
Erythema · hypersensitivity reactions · itching · mild burning sensation · occasional local irritation

SIDE-EFFECTS, FURTHER INFORMATION
Treatment should be discontinued if side effects are severe.

PRESCRIBING AND DISPENSING INFORMATION
Benzoic Acid Ointment, Compound, BP has also been referred to as Whitfield’s ointment.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

SALICYLIC ACID AND DERIVATIVES

Boric acid with salicylic acid and tannic acid

INDICATIONS AND DOSE
Fungal nail infection, particularly tinea
- BY TRANSUNGUAL APPLICATION
- Child 5–17 years: Apply twice daily, and after washing

CAUTIONS
Avoid broken or inflamed skin · contact with eyes and mucous membranes should be avoided · use with caution in children likely to suck affected digits

CAUTIONS, FURTHER INFORMATION
- Salicylate toxicity Salicylate toxicity can occur particularly if applied on large areas of skin.

SIDE-EFFECTS
Burningsensation · erythema · hypersensitivity reactions · itching · occasional local irritation

SIDE-EFFECTS, FURTHER INFORMATION
Treatment should be discontinued if side-effects are severe.

PREGNANCY
Avoid.

LESS SUITABLE FOR PRESCRIBING
Phytex® is less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

2.3 Parasitic skin infections

Other drugs used for Parasitic skin infections Ivermectin, p. 367

PARASITICIDES

Dimeticone

INDICATIONS AND DOSE
Head lice
- TO THE SKIN
- Child: Apply once weekly for 2 doses, rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)

UNLICENSED USE
Not licensed for use in children under 6 months except under medical supervision.

CAUTIONS
Avoid contact with eyes · children under 6 months, medical supervision required

SIDE-EFFECTS
Skin irritation

PATIENT AND CARER ADVICE
Patients should be told to keep hair away from fire and flames during treatment.
Medicines for Children leaflet: Aciclovir cream for herpes www.medicinesforchildren.org.uk/aciclovir-cream-for-herpes
3 Inflammatory skin conditions

3.1 Eczema and psoriasis

Eczema

Types and management

The main types of eczema (dermatitis) in children are atopic, irritant and allergic contact; different types may co-exist. **Atopic eczema** is the most common type and it usually involves dry skin as well as infection and lichenification caused by scratching and rubbing. **Seborrhoeic dermatitis** is also common in infants.

Management of eczema involves the removal or treatment of contributory factors; known or suspected irritants and contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; **BNF for Children** lists active ingredients together with excipients that have been associated with skin sensitisation.

Skin dryness and the consequent irritant eczema requires **emollients** applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

**Topical corticosteroids** are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition, and the age of the child. Mild corticosteroids are generally used on the face and on flexures; the more potent corticosteroids are generally required for use on lichenified areas of eczema or for severe eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In children with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 715) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. Wet elasticated viscose stockinette is used for ‘wet-wrap’ bandaging over topical corticosteroids or emollients to cool the skin and relieve itching, but there is an increased risk of infection and excessive absorption of the corticosteroid; ‘wet-wrap’ bandaging should be used under specialist supervision.

See **Wound management products and elasticated garments** for details of elasticated viscose stockinette bandages and garments, and silk clothing.

See Eczema and psoriasis, drugs affecting the immune response p. 701 for the role of topical pimecrolimus p. 718 and tacrolimus p. 718 in atopic eczema.

Infection

Bacterial infection (commonly with *Staphylococcus aureus* and occasionally with *Streptococcus pyogenes*) can exacerbate eczema. A topical antibacterial may be used for small areas of mild infection; treatment should be limited to a short course (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving moderate to severe, widespread, or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Preparations that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Intertriginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid combined with a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema (eczema herpeticum) and treatment under specialist supervision with a systemic antiviral drug is indicated. Secondary bacterial infection often exacerbates eczema herpeticum.

Management of other features of eczema

**Lichenification**, which results from repeated scratching, is treated initially with a potent corticosteroid. Bandages containing ichthammol p. 715 (to reduce pruritus) and other substances such as **zinc oxide** can be applied over the corticosteroid or emollient. **Coal tar** and ichthammol can be useful in some cases of **chronic eczema**. **Discoïd eczema**, with thickened plaques in chronic atopic eczema, is usually treated with a topical antiseptic preparation, a potent topical corticosteroid, and paste bandages containing ichthammol with zinc oxide.

A **non-sedating** antihistamine may be of some value in relieving severe itching or urticaria associated with eczema. A **sedating** antihistamine can be used at night if itching causes sleep disturbance, but a large dose may be needed and drowsiness may persist on the following day.

**Exudative** (‘weeping’) eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate solution (1 in 10,000) p. 731 can be used as a soak in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

**Severe refractory eczema** is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system.

**Seborrhoeic dermatitis**

**Seborrhoeic dermatitis** (seborrhoeic eczema) is associated with species of the yeast *Malassezia*. **Infantile seborrhoeic dermatitis** affects particularly the body folds, nappy area and scalp; it is treated with emollients and mild topical corticosteroids with suitable antimicrobials. Infantile seborrhoeic dermatitis affecting the scalp (cradle cap) is treated by hydrating the scalp using natural oils and the use of mild shampoo.

In older children, seborrhoeic dermatitis affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 695 and coal tar) and combinations of mild topical corticosteroids with suitable antimicrobials are used to treat older children.
Medicated bandages
Zinc paste bandages (see Wound management products and elasticated garments) are used with coal tar or ichthammol in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions.

Eczema and psoriasis, drugs affecting the immune response

Overview
Drugs affecting the immune response are used for eczema or psoriasis. Pimecrolimus p. 718 by topical application is licensed for mild to moderate atopic eczema. Tacrolimus p. 718 is licensed for topical use in moderate to severe atopic eczema. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatment unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in treating atopic eczema.

Topical corticosteroids have a role in eczema and a limited role in psoriasis. A systemic corticosteroid such as prednisolone p. 421 may be used in severe refractory eczema. Systemic drugs acting on the immune system are generally used by specialists in a hospital setting.

Ciclosporin p. 496 by mouth can be used for severe psoriasis and for severe eczema. Azathioprine p. 495 or mycophenolate mofetil p. 503 are also used for severe refractory eczema in children.

Methotrexate p. 517 can be used for severe resistant psoriasis; the dose is given once weekly and adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 546 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid can be given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Etanercept p. 616 (a cytokine modulator) is licensed in children over 6 years of age for the treatment of severe plaque psoriasis that is inadequately controlled by other systemic treatments and photochemotherapy, or when these other treatments cannot be used because of intolerance or contraindications.

Adalimumab p. 614 (a cytokine modulator) is licensed in children over 4 years for the treatment of severe chronic plaque psoriasis that is inadequately controlled by other topical treatments and phototherapies, or when these treatments are inappropriate.

Psoriasis

Management
Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp. For mild psoriasis, reassurance and treatment with an emollient may be all that is necessary. Guttate psoriasis is a distinctive form of psoriasis that characteristically occurs in children and young adults, often following a streptococcal throat infection or tonsillitis.

Occasionally psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not occur until the drug has been taken for weeks or months.

Emollients, in addition to their effects on dryness, scaling and cracking, may have an antiproliferative effect in psoriasis. They are particularly useful in inflammatory psoriasis and in chronic stable plaque psoriasis.

For chronic stable plaque psoriasis on extensor surfaces of trunk and limbs preparations containing coal tar are moderately effective, but the smell is unacceptable to some children. Vitamin D and its analogues are effective and cosmetically acceptable alternatives to preparations containing coal tar or dithranol p. 715. Dithranol is an effective topical antipsoriatic agent but it irritates and stains the skin and it should be used only under specialist supervision. Adverse effects of dithranol are minimised by using a ‘short-contact technique’ and by starting with low concentration preparations. Tazarotene, a topical retinoid for the treatment of mild to moderate plaque psoriasis, is not recommended for use in children under 18 years. These medications can irritate the skin particularly in the flexures and they are not suitable for the more inflammatory forms of psoriasis; their use should be suspended during an inflammatory phase of psoriasis. The efficacy and the irritancy of each substance varies between patients. If a substance irritates significantly, it should be stopped or the concentration reduced; if it is tolerated, its effects should be assessed after 4 to 6 weeks and treatment continued if it is effective.

Widespread unstable psoriasis of erythrodermic or generalised pustular type requires urgent specialist assessment. Initial topical treatment should be limited to using emollients frequently and generously. More localised acute or subacute inflammatory psoriasis with hot, spreading or itchy lesions, should be treated topically with emollients or with a corticosteroid of moderate potency.

Scalp psoriasis is usually scaly, and the scale may be thick and adherent. This requires softening with an emollient, cream, or oil and usually combined with salicylic acid as a keratolytic.

Some preparations for psoriasis affecting the scalp combine salicylic acid with coal tar or sulfur. The preparation should be applied generously and left on for at least an hour, often more conveniently overnight, before washing it off. If a corticosteroid lotion or gel is required (e.g. for itch), it can be used in the morning.

Flexural psoriasis can be managed with short-term use of a mild potency topical corticosteroid. Calcipotriol p. 720 or tacalcitol p. 721 can be used in the longer term; calcipotriol p. 720 is more likely to cause irritation in flexures and should be avoided. Low-strength tar preparations can also be used.

Facial psoriasis can be treated with short-term use of a mild topical corticosteroid; if this is ineffective, calcipotriol, tacalcitol, or a low-strength tar preparation can be used. Calcipotriol and tacalcitol are analogues of vitamin D that affect cell division and differentiation. Calcipotriol is an active form of vitamin D. Vitamin D and its analogues are used as first-line treatment for plaque psoriasis; they do not smell or stain and they may be more acceptable than tar or dithranol products. Of the vitamin D analogues, tacalcitol and calcipotriol are less likely to irritate.

Coal tar p. 716 has anti-inflammatory properties that are useful in chronic plaque psoriasis; it also has antiscaling properties. Contact of coal tar products with normal skin is not normally harmful and preparations containing coal tar can be used for widespread small lesions; however, irritation, contact allergy, and sterile folliculitis can occur. Preparations that remain in contact with the skin, such as creams or ointments, containing up to 6% coal tar may be used on children 1 month to 2 years; leave-on preparations containing coal tar 10% may be used on children over 2 years with more severe psoriasis. Tar baths and tar shampoos may also be helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual
susceptibility varies) and staining of skin and of clothing. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 20–30 minutes (‘short contact’ technique). Specialist nurses may apply intensive treatment with dithranol paste which is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

A topical corticosteroid is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis e.g. erythrodemic psoriasis or generalised pustular psoriasis on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures with a mild corticosteroid, and psoriasis of the scalp, palms, and soles with a potent corticosteroid. Very potent topical corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. Eczema co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

Phototherapy
Phototherapy is available in specialist centres under the supervision of a dermatologist. Narrow band ultraviolet B (UVB) radiation is usually effective for chronic stable psoriasis and for generalised guttate psoriasis. It can be considered for children with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis. The use of phototherapy and photochemotherapy in children is limited by concerns over carcinogenicity and premature ageing.

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including the localised palmoplantar pustular psoriasis. Early adverse effects include photosensitivity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

Systemic treatment
Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (see Eczema and psoriasis, drugs affecting the immune response p. 701).

Acitretin p. 719, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication for acitretin is severe psoriasis resistant to other forms of therapy. It is also used in disorders of keratinisation such as severe Darier’s disease (keratosis follicularis), and some forms of ichthyosis. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases; adverse effects are a limiting factor. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. Continuous treatment for longer than 6 months is not usually necessary in psoriasis. However, some patients, particularly those with severe ichthyosis, may benefit from longer treatment, provided that the lowest effective dose is used, patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly. Topical preparations containing keratolytics should normally be stopped before administration of acitretin. Liberal use of emollients should be encouraged and topical corticosteroids can be continued if necessary.

Acitretin is teratogenic; in females of child-bearing age, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progesterogen–only contraceptives not considered effective).

Corticosteroids
Topical corticosteroids

Overview
Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), particularly eczema, contact dermatisis, insect stings, and eczema of scabies.

Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the child’s condition.

In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. Topical corticosteroids may worsen ulcerated or secondarily infected lesions. They should not be used indiscriminately in pruritus (where they will only benefit if inflammation is causing the itch) and are not recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). Topical use of potent corticosteroids on widespread psoriasis can lead to systemic as well as to local side-effects. It is reasonable, however, to prescribe a mild topical corticosteroid for a short period (2–4 weeks) for
flexural and facial psoriasis, and to use a more potent corticosteroid such as betamethasone p. 705 or fluocinonide p. 708 for psoriasis of the scalp, palms, or soles.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus, and palmoplantar pustulosis. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances.

When topical treatment has failed, intralesional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as keloid scars, hypertrophic lichen planus, or localised alopecia areata.

**Periural lesions**

Hydrocortisone cream 1% p. 709 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole cream or ointment p. 714 is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include Candida spp. and many Gram-positive bacteria including streptococci and staphylococci.

**Choice**

Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. Occlusive polythene or hydrocolloid dressings increase absorption, but also increase the risk of side-effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). Disposable nappies and tight fitting pants also increase the risk of side-effects by increasing absorption of the corticosteroid. The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.

In the **BNF for Children**, topical corticosteroids for the skin are categorised as ‘mild’, ‘moderately potent’, ‘potent’ or ‘very potent’; the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

Topical hydrocortisone is usually used in children under 1 year of age. Moderately potent and potent topical corticosteroids should be used with great care in children and for short periods (1–2 weeks) only. A very potent corticosteroid should be initiated under the supervision of a specialist.

Appropriate topical corticosteroids for specific conditions are:

- **insect bites and stings**—mild corticosteroid such as hydrocortisone 1% cream;
- **inflamed nappy rash causing discomfort** in infant over 1 month—mild corticosteroid such as hydrocortisone 0.5% or 1% for up to 7 days (combined with antimicrobial if infected);
- **mild to moderate eczema, flexural and facial eczema or psoriasis**—mild corticosteroid such as hydrocortisone 1%;
- **severe eczema of the face and neck**—moderately potent corticosteroid for 3–5 days only, if not controlled by a mild corticosteroid;
- **severe eczema on the trunk and limbs**—moderately potent or potent corticosteroid for 1–2 weeks only, switching to a less potent preparation as the condition improves;
- **eczema affecting area with thickened skin (e.g. soles of feet)**—potent topical corticosteroid in combination with urea or salicylic acid (to increase penetration of corticosteroid).

**Absorption through the skin**

**Mild and moderately potent** topical corticosteroids are associated with few side-effects but particular care is required when treating neonates and infants, and in the use of **potent** and very potent corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing’s syndrome, depending on the area of the body being treated and the duration of treatment. Absorption of corticosteroid is greatest from severely inflamed skin, thin skin (especially on the face or genital area), from flexural sites (e.g. axillae, groin), and in infants where skin surface area is higher in relation to body-weight; absorption is increased by occlusion.

**Compound preparations**

The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

**Topical corticosteroid preparation potencies**

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

**Mild**

- Hydrocortisone 0.1–2.5%
- Dioderm
- Mildison
- Synalar 1 in 10 dilution

**Mild with antimicrobials**

- Canesten HC
- Daktapect
- Econacort
- Fucidin H
- Nystaform-HC
- Terra-Cortril
- Timodine

**Moderate**

- Betnovate-RE
- Eumovate
- Haelan
- Modrasone
- Synalar 1 in 4 Dilution
- Ultralanum Plain

**Moderate with antimicrobials**

- Trimovate

**Moderate with urea**:

- Alphaderm

**Potent**

- Beclometasone dipropionate 0.025%
- Betamethasone valerate 0.1%
- Betacap
- Betesil
- Bettamousse
- Betnovate
- Cutivate
- Diprosone
- Elocon
- Hydrocortisone butyrate
- Locoid
Corticosteroids (topical)

- CONTRA-INDICATIONS Acne • perioral dermatitis • potent corticosteroids in widespread plaque psoriasis • untreated bacterial, fungal or viral skin lesions
- CAUTIONS Avoid prolonged use (particularly on the face) • cautions applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use • dermatoses of infancy, including nappy rash (extreme caution required—treatment should be limited to 5–7 days) • infection • keep away from eyes • use potent or very potent topical corticosteroids under specialist supervision
- SIDE-EFFECTS
  - Rare Adrenal suppression • Cushing’s syndrome
  - Frequency not known Acne • contact dermatitis • hypertrichosis • irreversible striae atrophicae • irreversible telangiectasia • mild depigmentation (may be reversible) • perioral dermatitis • side-effects applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use • spreading and worsening of untreated infection • thinning of the skin (may be restored over a period after stopping treatment but the original structure may never return) • worsening of acne • worsening of rosacea

SIDE-EFFECTS, FURTHER INFORMATION
In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.

- DIRECTIONS FOR ADMINISTRATION Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a fingertip unit (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.
  - ‘Wet-wrap bandaging’ increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.

- PRESCRIBING AND DISPENSING INFORMATION The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer corticosteroid creams and ointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

### Alclometasone dipropionate

#### INDICATIONS AND DOSE

**Inflammatory skin disorders such as eczemas**

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Alclometasone dipropionate cream 0.05%: moderate

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **PATIENT AND CARER ADVICE** Patients or carers should be counselled on the application of alclometasone dipropionate cream.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Cream**

  CAUTIONARY AND ADVISORY LABELS 28

  EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol

  - Alclometasone dipropionate (Non-proprietary)
    
    Alclometasone dipropionate 500 microgram per 1 gram

    Boots Derma Care Eczema & Dermatitis Flare-Up 0.05% cream

    15 gram [F] no price available

### Beclometasone dipropionate (Beclometasone dipropionate)

#### INDICATIONS AND DOSE

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids / Psoriasis**

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, thin layer to be applied

**POTENCY**

Beclometasone dipropionate cream and ointment 0.025%: potent

- **UNLICENSED USE** Not licensed for use in children under 1 year.

- **INTERACTIONS** → Appendix 1: corticosteroids

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

  **Cream**

  CAUTIONARY AND ADVISORY LABELS 28

  - Beclometasone dipropionate (Non-proprietary)

    Beclometasone dipropionate 250 microgram per

    1 gram Beclometasone 0.025% cream | 30 gram [F] £68.00

    price = £68.00

- **Medicinal forms**
Betamethasone

- **INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- **TO THE SKIN**
- Child: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Betamethasone valerate 0.025% cream and ointment: moderate. Betamethasone valerate 0.1% cream, lotion, ointment, and scalp application: potent. Betamethasone valerate 0.12% foam: potent. Betamethasone dipropionate 0.05% cream, lotion, and ointment: potent.

- **UNLICENSED USE**

Betacap®, Betnovate® and Betnovate-R® are not licensed for use in children under 1 year. Bettamousse® is not licensed for use in children under 6 years.

- **CAUTIONS**

Use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression

- **INTERACTIONS** → Appendix 1: corticosteroids

- **PATIENT AND CARER ADVICE**

Patient counselling is advised for betamethasone cream, ointment, scalp application and foam (application).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Foam**

**Clobetasol propionate**

**INDICATIONS AND DOSE**

Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas unresponsive to less potent corticosteroids

- Psoriasis
  - TO THE SKIN
  - Child: Apply 1–2 times a day for up to 4 weeks, to be applied thinly

**POTENCY**

Clobetasol propionate 0.05% cream, foam, ointment, scalp application, and shampoo: very potent.

**UNLICENSED USE** Dermovate® not licensed for use in children under 1 year.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer clobetasol propionate foam, liquid (scalp application), cream, ointment and shampoo.

Scalp application Patients or carers should be advised to apply foam directly to scalp lesions (foam begins to subside immediately on contact with skin).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, paste

Hydrocortisone

18-May-2017

- INDICATIONS AND DOSE
  - MILD INFLAMMATORY SKIN DISORDERS SUCH AS ECZEMAS
    - TO THE SKIN
    - Child: Apply 1–2 times a day, to be applied thinly
  - NAPPY RASH
    - TO THE SKIN
    - Child: Apply 1–2 times a day for no longer than 1 week, discontinued as soon as the inflammation subsides
  - POTENCY
    - Hydrocortisone cream and ointment 0.5 to 2.5%: mild
  - INTERACTIONS → Appendix 1: corticosteroids
  - PRESCRIBING AND DISPENSING INFORMATION
    - When hydrocortisone cream or ointment is prescribed and no strength is stated, the 1% strength should be supplied. Although Dioderm® contains only 0.1% hydrocortisone, the formulation is designed to provide a clinical activity comparable to that of Hydrocortisone Cream 1% BP.
  - PATIENT AND CARER ADVICE
    - Patient counselling is advised for hydrocortisone cream and ointment (application).
  - PROFESSION SPECIFIC INFORMATION
    - Dental practitioners’ formulary
      - Hydrocortisone Cream 1% 15 g may be prescribed.
  - EXCEPTIONS TO LEGAL CATEGORY
    - Skin creams and ointments containing hydrocortisone (alone or with other ingredients) can be sold to the public for the treatment of allergic contact dermatitis, irritable dermatitis, insect bite reactions and mild to moderate eczema in patients over 10 years, to be applied sparingly over the affected area 1–2 times daily for max. 1 week. Over-the-counter hydrocortisone preparations should not be sold without medical advice for children under 10 years or for pregnant women; they should not be sold for application to the face, anogenital region, broken or infected skin (including cold sores, acne, and athlete’s foot).
  - MEDICINAL FORMS
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid, cream, ointment

- **Betamethasone with neomycin (Non-proprietary)**
  - Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram | Betamethasone valerate 0.1% / Neomycin 0.5% • cream | 30 gram | £38.88 DT price = £31.36
  - 100 gram | £37.00 DT price = £30.52

Betamethasone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 705, fusidic acid p. 342.

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- **TO THE SKIN**
  - Child: (consult product literature)

**POTENCY**

Betamethasone (as valerate) 0.1% with fusidic acid cream: potent.

**UNLICENSED USE**

Fucibet® Lipid Cream is not licensed for use in children under 6 years.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer betamethasone with fusidic acid preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS**

- **Betamethasone with fusidic acid (Non-proprietary)**
  - Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Fusidic acid 20 mg per 1 gram | Betamethasone valerate 0.1% / Fusidic acid 2% • cream | 30 gram | £7.71 DT price = £6.38
  - 60 gram | £15.42 DT price = £12.76

  - Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Fusidic acid 20 mg per 1 gram | Fucibet cream | 30 gram | £6.38 DT price = £6.38
  - 60 gram | £12.76 DT price = £12.76
  - Fucibet Lipid cream | 30 gram | £6.74 DT price = £6.38

- Xemacort (Mylan Ltd)
  - Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Fusidic acid 20 mg per 1 gram | Xemacort cream | 30 gram | £6.05 DT price = £6.38
  - 60 gram | £12.45 DT price = £12.76

Betamethasone with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 705.

**INDICATIONS AND DOSE**

**DIPROSALIC® OINTMENT**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, max. 60 g per week

**POTENCY**

For Dipsoralic® ointment: Betamethasone (as dipropionate) 0.05% with salicylic acid 3%: potent.

**DIPROSALIC® SCALP APPLICATION**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, apply a few drops

**POTENCY**

For Dipsoralic® scalp application: Betamethasone (as dipropionate) 0.05% with salicylic acid 2%: potent.
**Chlordetracycline with triamcinolone**

- **INDICATIONS AND DOSE**
  Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (associated with infection) | Psoriasis (associated with infection)
  - TO THE SKIN
  - Child 1 month–7 years: To be applied thinly (consult product literature)
  - Child 8–17 years: To be applied thinly (consult product literature)

- **POTENCY**
  Triamcinolone acetone 0.1%, chlordetracycline hydrochloride 3% ointment: potent.

- **UNLICENSED USE**
  Not licensed for use in children under 8 years.

- **PATIENT AND CARER ADVICE**
  Stains clothing. Patients or carers should be counselled on the application of chlordetracycline with triamcinolone products.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**Clobetasol propionate with neomycin sulfate and nystatin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasol propionate p. 706, neomycin sulfate p. 662.

- **INDICATIONS AND DOSE**
  Short-term treatment only of severe resistant inflammatory skin disorders such as recalcitrant eczemas associated with infection and unresponsive to less potent corticosteroids | Psoriasis associated with infection
  - TO THE SKIN
  - Child: (consult product literature)

- **POTENCY**
  Clobetasol propionate 0.05% with neomycin sulfate and nystatin cream and ointment: very potent.

- **UNLICENSED USE**
  Clobetasol with neomycin and nystatin preparations not licensed for use in children under 2 years.

- **PATIENT AND CARER ADVICE**
  Patients or carers should be advised on application of clobetasol propionate, neomycin sulfate and nystatin containing preparations.

**Fluocinolone acetonide with clioquinol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 707.
**Fluocinolone acetonide with neomycin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 707, neomycin sulfate p. 692.

### Indications and Dose

**Inflammatory skin disorders such as eczemas associated with infection**

- **To the skin**
- Child 1-11 months: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
- Child 1-17 years: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

**Potency**

Fluocinolone acetonide 0.025% with neomycin 0.5% cream and ointment: potent.

### Patient and Carer Advice

Patients or carers should be counselled on the application of fluocinolone acetonide with neomycin preparations.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Propylene glycol, wool fat and related substances including lanolin

- Synalar C (Reig Jofre UK Ltd)

  Fluocinolone acetonide 250 microgram per 1 gram, Clioquinol 30 mg per 1 gram
  
  Synalar C ointment | 15 gram | £2.66

**Cream**

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol

- Synalar C (Reig Jofre UK Ltd)

  Fluocinolone acetonide 250 microgram per 1 gram, Clioquinol 30 mg per 1 gram
  
  Synalar C cream | 15 gram | £2.66

**CAUTIONARY AND ADVISORY LABELS**

- **CAUTIONS** Avoid sensitive areas of skin
- **SIDE-EFFECTS** Skin irritation

**DERMATOLOGICAL DRUGS** > **ANTRACEN DERIVATIVES**

**Dithranol** (Anthralin)

**INDICATIONS AND DOSE**

**Subacute and chronic psoriasis**

- **TO THE SKIN**
  - **Child**: (consult product literature)

**DITHROCREAM**

**Subacute and chronic psoriasis**

- **TO THE SKIN**
  - **Child**: For application to skin or scalp, 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)

**MICANOL**

**Subacute and chronic psoriasis**

- **TO THE SKIN**
  - **Child**: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

**UNLICENSED USE**

**DITHROCREAM** **Dithrocream** is licensed for use in children (age range not specified by manufacturer).

**MICANOL** **Micanol** licensed for use in children, but not recommended for infants or young children (age range not specified by manufacturer).

**CONTRA-INDICATIONS** Acute and pustular psoriasis - hypersensitivity

**CAUTIONS** Avoid sensitive areas of skin - avoid use near eyes

**SIDE-EFFECTS** Local burning sensation - local irritation - stains hair - stains skin

**PREGNANCY** No adverse effects reported.

**BREAST FEEDING** No adverse effects reported.

**DIRECTIONS FOR ADMINISTRATION** When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic extensor plaques only, carefully avoiding normal skin.

**MICANOL** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.

**PRESCRIBING AND DISPENSING INFORMATION** Treatment should be started with a low concentration such as dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance.

**PATIENT AND CARER ADVICE** Dithranol can stain the skin, hair and fabrics.

**EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Subacute and chronic psoriasis**

- TO THE SKIN
- Child: Apply up to twice daily

**UNLICENSED USE** Psorin® is licensed for use in children (age range not specified by manufacturer).

**MEDITICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, cream, scalp lotion, shampoo.

Coal tar with lecithin

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 716.

**INDICATIONS AND DOSE**

**PSORIDERM® CREAM**

- **Psoriasis**
  - TO THE SKIN
  - Child: Apply 1–2 times a day, cream to be applied to the skin or scalp

**PSORIDERM® SCALP LOTION**

- **Scalp psoriasis**
  - TO THE SKIN
  - Child: Apply as required

**MEDITICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Cream: May contain isopropyl palmitate, propylene glycol. Lecithin 4 mg per 1 gram, Coal tar distilled 60 mg per 1 gram. Psoriderm cream 225 ml £9.42. Shampoo: May contain Disodium edetate. Psoriderm 4 mg per 1 gram, Coal tar distilled 60 mg per 1 gram. Psoriderm scalp lotion 250 ml £4.74.

Coal tar with salicylic acid and precipitated sulfur

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 716.

**INDICATIONS AND DOSE**

**COCOIS® OINTMENT**

- **Scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff**
  - INITIALLY TO THE SKIN USING SCALP OINTMENT
  - Child 6–11 years: Medical supervision required
  - Child 12–17 years: Apply once weekly as required, alternatively to the skin apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

**MEDITICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.
**Pimecrolimus**

**INDICATIONS AND DOSE**
- **Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)**
  - **TO THE SKIN**
  - Child 2–17 years: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

**CONTRA-INDICATIONS** Application to malignant or potentially malignant skin lesions • application under occlusion • congenital epidermal barrier defects • contact with eyes • contact with mucous membranes • generalised erythroderma • immunodeficiency • infection at treatment site

**CAUTIONS** Alcohol consumption (risk of facial flushing and skin irritation) • avoid other topical treatments except emollients at treatment site • UV light (avoid excessive exposure to sunlight and sunlamps)

**INTERACTIONS** → Appendix 1: pimecrolimus

**SIDE-EFFECTS**
- **Common or very common** Burning sensation • erythema • folliculitis • pruritus • skin infections
- **Uncommon** Herpes simplex • herpes zoster • impetigo • molluscum contagiosum
- **Rare** Dryness • local reactions including pain • oedema • papilloma • paraesthesia • peeling • skin discoloration • worsening of eczema
- **Frequency not known** Skin malignancy

**PREGNANCY** Manufacturer advises avoid; toxicity in animal studies following systemic administration.

**BREAST FEEDING** Manufacturer advises caution; ensure infant does not come in contact with treated areas.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)
- **Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82**

Topical pimecrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).

Topical pimecrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years. Pimecrolimus should be used within its licensed indications.

RETINOID AND RELATED DRUGS

Acitretin

◆ DRUG ACTION

Acitretin is a metabolite of etretinate.

◆ INDICATIONS AND DOSE

Severe extensive psoriasis resistant to other forms of therapy (under expert supervision) | Palmoplantar pustular psoriasis (under expert supervision) | Severe congenital ichthyosis (under expert supervision)

▶ BY MOUTH

Child 1 month–11 years: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required; maximum 35 mg per day

Child 12–17 years: Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

Severe Darier’s disease (keratosis follicularis) (under expert supervision)

▶ BY MOUTH

Child 1 month–11 years: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required; maximum 35 mg per day

Child 12–17 years: Initially 10 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily

Harlequin ichthyosis (under expert supervision)

▶ BY MOUTH

Neonate: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required.

◆ CONTRA-INDICATIONS

Hyperlipidaemia

◆ CAUTIONS

Avoid excessive exposure to sunlight and unsupervised use of sunlamps - diabetes (can alter glucose tolerance—in initial frequent blood glucose checks) - do not donate blood during and for 2 years after stopping therapy (teratogenic risk) - in children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported) - investigate atypical musculoskeletal symptoms

◆ INTERACTIONS

▶ Appendix 1: retinoids

◆ SIDE-EFFECTS

▶ Common or very common

Abdominal pain - abnormal hair texture - alopecia (reversible on withdrawal) - arthralgia - brittle nails - dermatitis - diarrhoea - dryness and inflammation of mucous membranes - dryness of conjunctiva (causing conjunctivitis and decreased tolerance to contact lenses) - epidermal fragility - erythema - headache - myalgia - nausea - paronychia - peripheral oedema - pruritus - reversible increase in serum-cholesterol (with high doses) - reversible increase in serum-triglyceride concentrations (with high doses) - skin exfoliation - sticky skin - vomiting

▶ Uncommon

Dizziness - hepatitis - photosensitivity - visual disturbances

▶ Rare

Peripheral neuropathy

▶ Very rare

Benign intracranial hypertension - bone pain - exostosis - night blindness - ulcerative keratitis

▶ Frequency not known

Drowsiness - dry skin - flushing - granulomatous lesions - impaired hearing - initial worsening of psoriasis - malaise - rectal haemorrhage - sweating - taste disturbance - tinnitus

SIDE-EFFECTS, FURTHER INFORMATION

Exostosis

Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which Acitretin is a metabolite) and premature epiphyseal closure in children.

Benign intracranial hypertension

Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.

◆ CONCEPTION AND CONTRACEPTION

Effective contraception must be used.

Pregnancy prevention

In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

◆ PREGNANCY

Avoid—teratogenic.

◆ BREAST FEEDING

Avoid.

◆ HEPATIC IMPAIRMENT

Avoid in severe impairment—risk of further impairment.

◆ RENAL IMPAIRMENT

Avoid in severe impairment; increased risk of toxicity.

◆ MONITORING REQUIREMENTS

Monitor serum-triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.

Check liver function at start, at least every 4 weeks for first 2 months and then every 3 months.

◆ PRESCRIBING AND DISPENSING INFORMATION

Prescribing for women of child-bearing potential. Each prescription for acitretin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription.
● **PATIENT AND CARER ADVICE** A patient information leaflet should be provided. Females of child-bearing potential must be advised on pregnancy prevention.

● **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

CAUTIONARY AND ADVISORY LABELS 10, 11, 21

- **Acitretin (Non-proprietary)**
  - Acitretin 10 mg  Acitretin 10mg capsules | 60 capsule  
    - DT price = £23.80
  - Acitretin 25 mg  Acitretin 25mg capsules | 60 capsule  
    - DT price = £55.24

- **Neotigason** (Teva UK Ltd)
  - Acitretin 10 mg Neotigason 10mg capsules | 60 capsule  
    - £17.30 DT price = £23.80 (Hospital only)
  - Acitretin 25 mg Neotigason 25mg capsules | 60 capsule  
    - £43.00 DT price = £55.24 (Hospital only)

**SALICYLIC ACID AND DERIVATIVES**

**Salicylic acid with zinc oxide**

● **INDICATIONS AND DOSE**
  **Hyperkeratotic skin disorders**
  - TO THE SKIN
  - Child: Apply twice daily

● **CAUTIONS** Avoid broken skin - avoid inflamed skin

CAUTIONS, FURTHER INFORMATION

- Salicylate toxicity Salicylate toxicity may occur particularly if applied on large areas of skin or neonatal skin.

● **SIDE-EFFECTS** Excessive drying - irritation - sensitivity - systemic effects (after widespread use)

**PRESCRIBING AND DISPENSING INFORMATION** Zinc and Salicylic Acid Paste BP is also referred to as Lassar's Paste. When prepared extemporaneously, the BP states Zinc and Salicylic Acid Paste, BP (Lassar's Paste) consists of zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.

● **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: paste

**VITAMINS AND TRACE ELEMENTS** > **VITAMIN D AND ANALOGUES**

**Calcipotriol**

● **INDICATIONS AND DOSE**
  **Plaque psoriasis**
  - TO THE SKIN USING OINTMENT
    - Child 6-11 years: Apply twice daily, when preparations used together maximum total calcipotriol 2.5 mg in any one week (e.g. scalp solution 20 mL with ointment 30 g); maximum 50 g per week
    - Child 12-17 years: Apply twice daily, when preparations used together maximum total calcipotriol 3.75 mg in any one week (e.g. scalp solution 30 mL with ointment 45 g); maximum 45 mL per week

- **Calcium analogues**
  - Manufacturers advise avoid in severe impairment.
  - **PREGNANCY** Manufacturers advise avoid in severe impairment.
  - **RENAIRED IMPAIRMENT** Manufacturers advise avoid in severe impairment.
  - **PATIENT AND CARER ADVICE** Advice on application Patient information leaflet for Dovonex® ointment advises liberal application. However, patients should be advised of maximum recommended weekly dose.
    - Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

● **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

**Ointment**

EXCIPIENTS: May contain Disodium edetate, propylene glycol

- **Calcipotriol (Non-proprietary)**
  - Calcipotriol 50 microgram per 1 gram Calcipotriol 50micrograms/g ointment | 30 gram  
    - DT price = £5.78  | 60 gram  
    - £11.56–£13.86  | 120 gram  
    - £23.12–£27.75
  - **Dovonex** (LEO Pharma)
    - Calcipotriol 50 microgram per 1 gram Dovonex 50micrograms/g ointment | 30 gram  
      - DT price = £5.78  | 60 gram  
      - £11.56

**Liquid**

- **Calcipotriol (Non-proprietary)**
  - Calcipotriol (as Calcipotriol hydrate) 50 microgram per 1 mL Calcipotriol 50micrograms/ml scalp solution | 60 mL  
    - DT price = £56.94  | 120 mL  
    - £113.88

Combinations available: **Calcipotriol with betamethasone**, p. 705

**Calcitriol**

(1,25-Dihydroxycholecalciferol)

● **INDICATIONS AND DOSE**
  **Mild to moderate plaque psoriasis**
  - TO THE SKIN
  - Child 12-17 years: Apply twice daily, not more than 35% of body surface to be treated daily; maximum 30 g per day

● **CONTRA-INDICATIONS** Do not apply under occlusion - patients with calcium metabolism disorders
CAUTIONS  Erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) · generalised pustular psoriasis (enhanced risk of hypercalcaemia)

INTERACTIONS  → Appendix 1: vitamin D substances

SIDE-EFFECTS
- Common or very common  Burning · dermatitis · erythema · itching · local skin reactions · paraesthesia
- Frequency not known  Aggravation of psoriasis
- PREGNANCY  Manufacturer advises use in restricted amounts only if clearly necessary.
  - Monitor urine- and serum-calcium concentration in pregnancy.
- BREAST FEEDING  Manufacturer advises avoid.
- HEPATIC IMPAIRMENT  Manufacturer advises avoid—no information available.
- RENAL IMPAIRMENT  Manufacturer advises avoid—no information available.
- HANDLING AND STORAGE  Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Ointment
- Siliks (Galderma (UK) Ltd)
  - Calcitriol 3 microgram per 1 gram  Siliks ointment  100 gram  £18.06 DT price = £18.06

Tacalcitol

INDICATIONS AND DOSE
Plaque psoriasis
- TO THE SKIN
  - Child 12-17 years: Apply once daily, preferably at bedtime, maximum 10 g ointment or 10 mL lotion daily, when lotion and ointment used together, maximum total tacalcitol 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

CONTRA-INDICATIONS  Calcium metabolism disorders
- CAUTIONS  Avoid eyes · erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia) · generalised pustular psoriasis (enhanced risk of hypercalcaemia) · if used in conjunction with UV treatment

CAUTIONS, FURTHER INFORMATION
- UV treatment  If tacalcitol is used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime.
- INTERACTIONS  → Appendix 1: vitamin D substances
- SIDE-EFFECTS
  - Common or very common  Burning · dermatitis · erythema · itching · local skin reactions · paraesthesia
  - Frequency not known  Aggravation of psoriasis
- PREGNANCY  Manufacturer advises avoid unless no safer alternative—no information available.
- BREAST FEEDING  Manufacturer advises avoid application to breast area; no information available on presence in milk.
- RENAL IMPAIRMENT  Monitor serum calcium concentration.
- MONITORING REQUIREMENTS  Monitor serum calcium if risk of hypercalcaemia.
- PATIENT AND CARER ADVICE  Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

4 Perspiration
4.1 Hyperhidrosis

Hyperhidrosis

Overview
Aluminium chloride hexahydrate p. 722 is a potent antiperspirant used in the treatment of axillary, palmar, and plantar hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

In more severe cases specialists use tap water or glycopyrronium bromide below (as a 0.05% solution) in the iontophoretic treatment of hyperhidrosis of palms and soles. Botox® contains botulinum toxin type A complex p. 248 and is available for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment; intradermal treatment is unlikely to be tolerated by most children and should be administered under hospital specialist supervision.

ANTIMUSCARINICS

Glycopyrronium bromide

17-Oct-2016

INDICATIONS AND DOSE
Iontophoretic treatment of hyperhidrosis
- TO THE SKIN
  - Child: Only 1 site to be treated at a time, maximum 2 sites treated in any 24 hours, treatment not to be repeated within 7 days (consult product literature)

UNLICENSED USE  Licensed for use in children (age range not specified by manufacturer).

CONTRA-INDICATIONS  Infections affecting the treatment site

CONTRA-INDICATIONS, FURTHER INFORMATION
Contra-indications applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

CAUTIONS
CAUTIONS, FURTHER INFORMATION
Cautions applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

INTERACTIONS  → Appendix 1: glycopyrronium
Pruritus

Overview

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (such as eczema, psoriasis, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying cause should be treated. Local antipruritics have a role in the treatment of pruritus in palliative care. Pruritus caused by cholestasis generally requires a bile acid sequestrant.

An emollient may be of value where the pruritus is associated with dry skin. Preparations containing calamine or crotamiton p. 723 are sometimes used but are of uncertain value.

A topical preparation containing doxepin 5% p. 723 is licensed for the relief of pruritus in eczema in children over 12 years; it can cause drowsiness and there may be a risk of sensitisation.

Topical antihistamines and local anaesthetics are only marginally effective and occasionally cause sensitisation. For insect stings and insect bites, a short course of a topical corticosteroid is appropriate. Short-term treatment with a sedating antihistamine may help in insect stings and in intractable pruritus where sedation is desirable. Calamine preparations are of little value for the treatment of insect stings or bites.

In pruritus ani, the underlying cause such as faecal soiling, eczema, psoriasis, or helminth infection should be treated.

Other drugs used for Pruritus

Antipruritics

Calamine with zinc oxide

- **INDICATIONS AND DOSE**
  - **Pruritus**
  - TO THE SKIN
  - Child: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM UPDATE (APRIL 2016): FIRE RISK WITH PARAFFIN-BASED SKIN EMOLLIENTS ON DRESSINGS OR CLOTHING

### 6 Rosacea and acne

**Rosacea and Acne**

**Acne vulgaris in children**

Acne vulgaris commonly affects children around puberty and occasionally affects infants. Treatment of acne should be commenced early to prevent scarring; lesions may worsen before improving. The choice of treatment depends on age, severity, and whether the acne is predominantly inflammatory or comedonal.

**Mild to moderate acne** is generally treated with topical preparations, such as benzoyl peroxide p. 726, azelaic acid p. 726, and retinoids.

**For moderate to severe inflammatory acne** or where topical preparations are not tolerated or are ineffective or where application to the site is difficult, systemic treatment with oral antibacterials may be effective. Co-cyprindiol (cyproterone acetate with ethinylestradiol) p. 725 has androgenic properties and may be useful in young women with acne refractory to other treatments.

**Severe acne**, acne unresponsive to prolonged courses of oral antibacterials, acne with scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe oral isotretinoin p. 727.

**Neonatal and infantile acne**

Inflammatory papules, pustules, and occasionally comedones may develop at birth or within the first month; most neonates with acne do not require treatment. Acne developing at 3–6 months of age may be more severe and persistent; lesions are usually confined to the face. Topical preparations containing benzoyl peroxide (at the lowest strength possible to avoid irritation), adapalene p. 727, or tretinoin p. 729 may be used if treatment for infantile acne is necessary. In infants with inflammatory acne, oral erythromycin p. 316 is used because topical preparations for acne are not well tolerated. In cases of erythromycin-resistant acne, oral isotretinoin can be given on the advice of a consultant dermatologist.

**Topical preparations for acne**

In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide or topical retinoids. Alternatively, topical application of an antibacterial such as erythromycin or clindamycin p. 725 may be effective for inflammatory acne. However, topical antibacterials are probably no more effective than benzoyl peroxide and may promote the emergence of resistant organisms. If topical preparations prove inadequate, oral preparations may be needed. The choice of product and formulation (gel, solution, lotion, or cream) is largely determined by skin type, patient preference, and previous usage of acne products.

**Benzoyl peroxide and azelaic acid**

Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. The usefulness of benzoyl peroxide washes is limited by the short time the products are in contact with the skin. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with a reduction in benzoyl peroxide concentration, frequency, and area of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.
Azelaic acid has antimicrobial and anticomendal properties. It may be used as an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face; azelaic acid is less likely to cause local irritation than benzoyl peroxide.

**Topical antibacterials for acne**

In the treatment of mild to moderate inflammatory acne, topical antibacterials may be no more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for children who wish to avoid oral antibacterials or who cannot tolerate them.

Topical preparations of erythromycin and clindamycin may be used to treat *inflamed lesions* in mild to moderate acne when topical benzoyl peroxide or tretinoin is ineffective or poorly tolerated. Topical benzoyl peroxide, azelaic acid, or retinoids used in combination with an antibacterial (topical or systemic) may be more effective than an antibacterial used alone. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (but treatment with a topical preparation should be continued for at least 6 months).

**Topical retinoids and related preparations for acne**

Topical tretinoin, its isomer isotretinoin, and adapalene (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. Tretinoin can be used under specialist supervision to treat infantile acne; adapalene can also be used.

**Other topical preparations for acne**

A topical preparation of nicotinamide p. 730 is available for inflammatory acne.

**Oral preparations for acne**

**Oral antibacterials for acne**

Oral antibacterials may be used in moderate to severe *inflammatory acne* when topical treatment is not adequately effective or is inappropriate. Concomitant anticomendal treatment with topical benzoyl peroxide or azelaic acid may also be required.

Tetracyclines should not be given to children under 12 years. In children over 12 years, either oxytetracycline p. 339 or tetracycline p. 339 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer. Doxycycline p. 338 and lymecycline p. 338 are alternatives to tetracycline in children over 12 years.

Although minocycline p. 339 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Erythromycin is an alternative for the management of moderate to severe acne with inflamed lesions, but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response. In cases of erythromycin-resistant *P. acnes* in infants, oral isotretinoin may be used on the advice of a consultant dermatologist.

Concomitant use of different topical and systemic antibacterials is undesirable to the increased likelihood of the development of bacterial resistance.

**Hormone treatment for acne**

Co-cyprindiol (cyproterone acetate with ethinylestradiol) p. 725 contains an anti-androgen. It is no more effective than an oral broad-spectrum antibacterial but is useful in females of childbearing age who also wish to receive oral contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some females with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

**Oral retinoid for acne**

The retinoid isotretinoin p. 727 reduces sebum secretion. It is used for the systemic treatment of nodulo-cystic and conglobate acne, severe acne, acne with scarring, or for acne which has not responded to an adequate course of a systemic antibacterial. Isotretinoin is used for the treatment of severe infantile acne resistant to erythromycin p. 316. Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 16 weeks; repeat courses are not normally required. The drug is teratogenic and must not be given to females of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. They must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and specialist psychiatric advice should be sought.

**Rosacea**

The adult form of rosacea rarely occurs in children. Persistent or repeated use of potent topical corticosteroids may cause periorificial rosacea (steroid acne). The pustules and papules of rosacea may be treated for at least 6 weeks with a topical metronidazole preparation p. 692, or a systemic antibacterial such as erythromycin, or for a child over 12 years, oxytetracycline p. 339. Tetracyclines are contra-indicated in children under 12 years of age.
6.1 Acne

ANTI-ANDROGENS

Co-cyprindiol

- **INDICATIONS AND DOSE**
  - Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibiotics
  - Moderately severe hirsutism
    - **BY MOUTH**
    - Females of childbearing potential: 1 tablet daily for 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

- **CONTRA-INDICATIONS**
  - Acute porphyria p. 577 • gallstones • heart disease associated with pulmonary hypertension or risk of embolus • history during pregnancy of cholestatic jaundice • history during pregnancy of chorea • history during pregnancy of pemphigoid gestationis • history during pregnancy of puritus • history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable • history of haemolytic uraemic syndrome • migraine with aura • personal history of venous or arterial thrombosis • sclerosing treatment for varicose veins • severe or multiple risk factors for arterial disease or for venous thromboembolism • systemic lupus erythematosus with (or unknown) antiphospholipid antibodies • transient cerebral ischaemic attacks without headaches • undiagnosed vaginal bleeding

- **CAUTIONS**
  - Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • arterial disease • gene mutations associated with breast cancer (e.g. BRCA 1) • history of severe depression especially if induced by hormonal contraceptive • hyperprolactinaemia—seek specialist advice • inflammatory bowel disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

- **INTERACTIONS**
  - Appendix 1: combined hormonal contraceptives

- **SIDE-EFFECTS**
  - Rare • rarely gallstones • systemic lupus erythematosus
  - Very rare • Photosensitivety

  - Frequency not known
    - Abdominal cramps • absence of withdrawal bleeding • amenorrhoea after discontinuation • breast enlargement • breast secretion • breast tenderness • cervical erosion • changes in libido • changes in lipid metabolism • changes in vaginal discharge • chloasma • chorea • contact lenses may irritate • depression • fluid retention • headache • hepatic tumours • hypertension • irritability • leg cramps • liver impairment • nausea • nervousness • reduced menstrual loss • skin reactions • thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB • visual disturbances • vomiting • ‘spotting’ in early cycles

- **PREGNANCY**
  - Avoid—risk of feminisation of male fetus with cyproterone.

- **BREAST FEEDING**
  - Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.

- **HEPATIC IMPAIRMENT**
  - Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**
    - Co-cyprindiol (Non-proprietary)
      - Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Co-cyprindiol 2000microgram/35microgram tablets | 63 tablet (£5.70 DT price = £5.70)
      - Clairette (Stragen UK Ltd)
        - Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Clairette 2000/35 tablets | 63 tablet (£5.90 DT price = £5.70)
      - Dianette (Bayer Plc)
        - Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Dianette tablets | 63 tablet (£5.71 DT price = £5.70)
      - Teragezza (Morningside Healthcare Ltd)
        - Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Teragezza 2000microgram/35microgram tablets | 63 tablet (£11.10 DT price = £5.70)

**ANTIBACTERIALS > LINCOMAMIDES**

Clindamycin

- **INDICATIONS AND DOSE**

  - **DALACIN T® LOTION**
    - **Acne vulgaris**
      - TO THE SKIN
      - Child: Apply twice daily, to be applied thinly
  
  - **DALACIN T® SOLUTION**
    - **Acne vulgaris**
      - TO THE SKIN
      - Child: Apply twice daily, to be applied thinly
  
  - **ZINDACLIN® GEL**
    - **Acne vulgaris**
      - TO THE SKIN
      - Child 12–17 years: Apply once daily, to be applied thinly

- **INTERACTIONS**
  - Appendix 1: clindamycin

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Gel**
    - EXCIPIENTS: May contain Propylene glycol
      - Zindaclin (Crawford Healthcare Ltd)
        - Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram Zindaclin 1% gel | 30 gram (£8.66 DT price = £8.66)

  - **Cream**
    - EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol
      - Dalacin (Pfizer Ltd)
        - Clindamycin (as Clindamycin phosphate) 20 mg per 1 gram Dalacin 2% cream | 40 gram (£10.86 DT price = £10.86)

  - **Liquid**
    - EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol
Benzyol peroxide with clindamycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, benzyol peroxide above, clindamycin p. 725.

**Gel**

EXCIPIENTS: May contain Disodium edetate

- Duac (Stiefel Laboratories (UK) Ltd)
  - Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram,
    - Benzoyl peroxide 30 mg per 1 gram
    - Duac Once Daily gel (3% and 1%) | 30 gram £13.14 DT price = £13.14 | 60 gram £26.28
  - Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram,
    - Benzoyl peroxide 50 mg per 1 gram
    - Duac Once Daily gel (5% and 1%) | 30 gram £13.14 DT price = £13.14 | 60 gram £26.28

**DERMATOLOGICAL DRUGS > ANTICOMEDONALS**

**Azelaic acid**

**INDICATIONS AND DOSE**

**FINACEA**

Facial acne vulgaris

- TO THE SKIN
- Child 12-17 years: Apply twice daily, discontinue if no improvement after 1 month

**SKINOREN**

Acne vulgaris

- TO THE SKIN
- Child 12-17 years: Apply twice daily

**Acne vulgaris in patients with sensitive skin**

- TO THE SKIN
- Child 12-17 years: Apply once daily for 1 week, then apply twice daily

**CAUTIONS**

Avoid contact with eyes - avoid contact with mouth - avoid contact with mucous membranes

**SIDE-EFFECTS**

- Common or very common Local irritation (reduce frequency or discontinue temporarily)
- Uncommon Skin discoloration
- Frequency not known Worsening of asthma

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Propylene glycol

- Skinoren (Bayer Plc)
  - Azelaic acid 200 mg per 1 gram Skinoren 20% cream | 30 gram £3.74 DT price = £3.74

**Gel**

RETINOID AND RELATED DRUGS

Adapalene

- **INDICATIONS AND DOSE**
  - **Mild to moderate acne vulgaris**
    - **TO THE SKIN**
    - Child 12-17 years: Apply once daily, apply thinly in the evening
  - **Infantile acne**
    - **TO THE SKIN**
    - Child 1 month-1 year: Apply once daily, apply thinly in the evening

- **UNLICENSED USE** Not licensed for use in infantile acne.
- **CAUTIONS** Avoid accumulation in angles of the nose - avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including sunlight, sunlamps) - avoid in severe acne involving large areas - caution in sensitive areas such as the neck
- **INTERACTIONS** → Appendix 1: retinoids
- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas.
- **PATIENT AND CARER ADVICE** If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

Cream

- **CAUTIONARY AND ADVISORY LABELS** 11
- **EXCIPIENTS**: May contain Disodium edetate, hydroxybenzoates (parabens)
  - **Adapalene (Non-proprietary)**
    - Adapalene 1 mg per 1 gram | 45 gram £19.73 DT price = £16.43
  - **Differin (Galderma (UK) Ltd)**
    - Adapalene 1 mg per 1 gram | 45 gram £16.43 DT price = £16.43

Gel

- **CAUTIONARY AND ADVISORY LABELS** 11
- **EXCIPIENTS**: May contain Disodium edetate, propylene glycol
  - **Adapalene (Non-proprietary)**
    - Adapalene 1 mg per 1 gram | 45 gram £19.73 DT price = £16.43
  - **Differin (Galderma (UK) Ltd)**
    - Adapalene 1 mg per 1 gram | 45 gram £16.43 DT price = £16.43

Adapalene with benzoyl peroxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, adapalene above, benzoyl peroxide p. 726.

- **INDICATIONS AND DOSE**
  - **Acne vulgaris**
    - **TO THE SKIN**
    - Child 9-17 years: Apply once daily, to be applied thinly in the evening

- **INTERACTIONS** → Appendix 1: retinoids

- **CONCEPTION AND CONTRACEPTION** Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).
- **PATIENT AND CARER ADVICE** Gel may bleach clothing and hair.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (March 2014) that Epiduo® should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Gel**
    - **CAUTIONARY AND ADVISORY LABELS** 11
    - **EXCIPIENTS**: May contain Disodium edetate, propylene glycol
      - **Adapalene with benzoyl peroxide (Non-proprietary)**
        - Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per 1 gram | 45 gram £19.53 DT price = £19.53
      - **Epiduo (Galderma (UK) Ltd)**
        - Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per 1 gram | 45 gram £19.53 DT price = £19.53

Isotretinoin

- **INDICATIONS AND DOSE**
  - **Topical treatment of mild to moderate acne**
    - **TO THE SKIN**
    - Child: Apply 1–2 times a day, to be applied thinly

- **Severe acne (under expert supervision)**
  - Acne which is associated with psychological problems (under expert supervision) Acne which has not responded to an adequate course of a systemic antibacterial (under expert supervision) Acne with scarring (under expert supervision) Systemic treatment of nodulo-cystic and conglobate acne (under expert supervision)

  - **BY MOUTH**
    - **Child 12-17 years**: Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course

  - **Severe infantile acne (under expert supervision)**
    - **BY MOUTH**
    - **Child 1 month-1 year**: Initially 200 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks; maximum 150 mg/kg per course

- **UNLICENSED USE** Not licensed for use in infantile acne.
- **CONTRA-INDICATIONS**
  - With oral use Hyperlipidaemia - hypervitaminosis A
  - With topical use Perioral dermatitis - rosacea

- **CAUTIONS**
  - With oral use Avoid blood donation during treatment and for at least 1 month after treatment - diabetes - dry eye syndrome (associated with risk of keratitis) - history of depression - monitor for depression
  - With topical use Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid - alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) - avoid accumulation in angles of the nose - avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including
sunlight, solariums) - avoid in severe acne involving large areas - avoid use of topical retinoids with abrasive cleansers, comedogenic or astringent cosmetics - caution in sensitive areas such as the neck - personal or familial history of non-melanoma skin cancer

**INTERACTIONS** → Appendix 1: retinoids

**SIDE-EFFECTS**

- **Common or very common**
  - With oral use: Anaemia, arthralgia, dryness of eyes (with blepharitis and conjunctivitis), dryness of lips (sometimes cheilitis), dryness of nasal mucosa (with epistaxis), dryness of pharyngeal mucosa (with hoarseness), dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus) - epidermal fragility (trauma may cause blistering) - haematuria - headache - myalgia - neutropenia - proteinuria - raised blood-glucose concentration - raised plasma-triglyceride concentration - raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration) - raised serum-transaminase concentration - thrombocytopenia - thrombocytosis

- **Rare**
  - With oral use: Aggressive behaviour - alopecia - anxiety - depression - mood changes - skin reactions

- **Very rare**

- **Frequency not known**
  - With oral use: Stevens-Johnson syndrome - toxic epidermal necrolysis
  - With topical use: Blistering of skin - burning - crusting of skin - dry or peeling skin - erythema - eye irritation - increased sensitivity to UVB light or sunlight - oedema - pruritus - stinging

**SIDE-EFFECTS, FURTHER INFORMATION**

- Management of side-effects: Risk of pancreatitis if triglycerides above 9 mmol/litre — discontinue if uncontrolled hypertriglyceridaemia or pancreatitis. Psychiatric side-effects require expert referral. Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops. Visual disturbances require expert referral and possible withdrawal.

**CONCEPTION AND CONTRACEPTION**

- Pregnancy prevention
  - With oral use: Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment — perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.
  - With topical use: Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

- **PREGNANCY**
  - Contra-indicated in pregnancy (teratogenic).

- **BREAST FEEDING**
  - Avoid.

- **HEPATIC IMPAIRMENT**
  - With oral use: Avoid — further impairment may occur.

- **RENAL IMPAIRMENT**
  - With oral use: In severe impairment, reduce initial dose and increase gradually, if necessary, up to 1 mg/kg daily as tolerated.

**MONITORING REQUIREMENTS**

- With oral use: Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).

**PRESCRIBING AND DISPENSING INFORMATION**

- Isotretinoin is an isomer of tretinoin.

- **PATIENT AND CARER ADVICE**
  - With oral use: Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.
  - Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.
  - With topical use: Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medications containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 10, 11, 21

- Isotretinoin (Non-proprietary)

Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.
Scalp and hair conditions

Overview

The detergent action of shampoo removes grease (sebum) from hair. Prepubertal children produce very little grease and require shampoo less frequently than adults. Shampoos can be used as vehicles for medicinal products, but their usefulness is limited by the short time the product is in contact with the scalp and by their irritant nature.

Oils and ointments are very useful for scaly, dry scalp conditions; if a greasy appearance is cosmetically unacceptable, the preparation may be applied at night and washed out in the morning. Alcohol-based lotions are rarely used in children; alcohol causes painful stinging on broken skin and the fumes may exacerbate asthma. Inchy, inflammatory, eczematous scalp conditions may be relieved by a simple emollient oil such as olive oil or coconut oil (arachis oil (ground nut oil, peanut oil) is best avoided in children under 5 years). In more severe cases a topical corticosteroid may be required. Preparations containing coal tar are used for the common scaly scalp conditions of childhood including seborrhoeic dermatitis, dandruff (a mild form of seborrhoeic dermatitis), and psoriasis; salicylic acid is used as a keratolytic in some scalp preparations.

Shampoos containing antimicrobials such as selenium below or ketoconazole p. 695 are used for seborrhoeic dermatitis and dandruff in which yeast infection has been implicated, and for tinea capitis (ringworm of the scalp).

Bacterial infection affecting the scalp (usually secondary to eczema, head lice, or ringworm) may be treated with shampoos containing antimicrobials such as pyrithione zinc, cetrimide, or povidone-iodine p. 731. In neonates and infants, cradle cap (which is also a form of seborrhoeic eczema) can be treated by massaging coconut oil or olive oil into the scalp; a bland emollient such as emulsifying ointment can be rubbed onto the affected area once or twice daily before bathing and a mild shampoo used.

VITAMINS AND TRACE ELEMENTS

Selenium

**INDICATIONS AND DOSE**

Seborrhoeic dermatitis | Dandruff

**TO THE SKIN USING SHAMPOO**

Child 5-17 years: Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required

**UNLICENSED USE**

The use of selenium sulfide shampoo as a lotion for the treatment of pityriasis (tinea) versicolor is an unlicensed indication.

**INTERACTIONS**

Appendix 1: selenium
● **PATIENT AND CARER ADVICE** Avoid using 48 hours before or after applying hair colouring, straightening or waving preparations.

● **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**Shampoo**

EXCIPIENTS: May contain Fragrances

- Selsun (Chatterton (U.K.) Ltd)
  - Selenium sulfide 25 mg per 1 ml  Selsun 2.5% shampoo  50 ml  £1.61 DT price = £1.61  100 ml  £2.15 DT price = £2.15
  - 150 ml  £3.06 DT price = £3.06

# 8 Skin cleansers, antiseptics and desloughing agents

## Skin cleansers, antiseptics and desloughing agents

### Skin cleansers and antiseptics

Soap or detergent is used with water to cleanse intact skin but can irritate infantile skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry or irritated skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 732 or povidone-iodine below, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Preparations containing alcohol, and regular use of povidone-iodine, should be avoided on neonatal skin. Hydrogen peroxide p. 733, an oxidising agent, is available as a cream and can be used for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution p. 561 is used but tap water is often appropriate.

Potassium permanganate below solution 1 in 10 000, a mild antiseptic with astringent properties, can be used as a soak for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

### Desloughing agents

Alginate, hydrogel, and hydrocolloid dressings are effective in wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribed on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised.

### Antiseptics and disinfectants

#### Potassium permanganate

- **INDICATIONS AND DOSE**
  - Cleansing and deodorising suppurating eczematous reactions and wounds
  - **TO THE SKIN**
  - Child: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

- **CAUTIONS** Irritant to mucous membranes

- **DIRECTIONS FOR ADMINISTRATION** Potassium permanganate 0.1% solution to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution. With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.

- **PATIENT AND CARER ADVICE** Can stain clothing, skin and nails (especially with prolonged use).

#### Alcohol

**(Industrial methylated spirit)**

- **INDICATIONS AND DOSE**
  - **Skin preparation before injection**
    - **TO THE SKIN**
    - Child: Apply as required

- **CONTRA-INDICATIONS** Neonates

- **CAUTIONS** Avoid broken skin · flammable · patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

- **SIDE-EFFECTS**
  - **Overdose**
    - Features of acute alcohol intoxication include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis.
    - For details on the management of poisoning, see Alcohol, under Emergency treatment of poisoning p. 803.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Industrial methylated spirits defined by the BP as a mixture of 19 volumes of ethyl alcohol of an appropriate strength with 1 volume of approved wood naphtha.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

  **Tablet for cutaneous solution**

  - **Potassium permanganate (Non-proprietary)**
    - Potassium permanganate 400 mg Potassium permanganate 400mg tablets for cutaneous solution  30 tablet no price available DT price = £17.50
    - **Permitabs** (Alliance Pharmaceuticals Ltd)
    - Potassium permanganate 400 mg Permitabs 400mg tablets for cutaneous solution  30 tablet £17.50 DT price = £17.50

**ANTISEPTICS AND DISINFECTANTS > IODINE PRODUCTS**

#### Povidone-iodine

- **INDICATIONS AND DOSE**
  - **Skin disinfection**
    - **TO THE SKIN**
    - Child: (consult product literature) continued →
BETADINE® DRY POWDER SPRAY
Skin disinfection, particularly minor wounds and infections
- TO THE SKIN
- Child: 2-17 years: Not for use in serous cavities (consult product literature)

SAVLON® DRY
Skin disinfection of minor wounds
- TO THE SKIN
- Child: (consult product literature)

VIDENE® SOLUTION
Skin disinfection
- TO THE SKIN
- Child: Apply undiluted in pre-operative skin disinfection and general antisepsis

VIDENE® SURGICAL SCRUB®
Skin disinfection
- TO THE SKIN
- Child: Use as a pre-operative scrub for hand and skin disinfection

VIDENE® TINCTURE
Skin disinfection
- TO THE SKIN
- Child: Apply undiluted in pre-operative skin disinfection

CONTRA-INDICATIONS
Concomitant use of lithium - corrected gestational age under 32 weeks - infants bodyweight under 1.5 kg - regular use in neonates

VIDENE® TINCTURE Neonates

CAUTIONS
Broken skin - large open wounds

CAUTIONS, FURTHER INFORMATION
Large open wounds The application of povidone-iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

VIDENE® TINCTURE Procedures involving hot wire cautery and diathermy

SIDE-EFFECTS
Rare: Sensitivity

PREGNANCY
Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.

BREAST FEEDING
Avoid regular or excessive use.

RENAL IMPAIRMENT
Avoid regular application to inflamed or broken skin or mucosa.

EFFECT ON LABORATORY TESTS
May interfere with thyroid function tests.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

Spray
- Betadine (Aspire Pharma Ltd)
  Povidone-iodine 25 mg per 1 gram Betadine 2.5% dry powder spray
    - 100 ml GSL £9.95 DT price = £9.95

Liquid
CAUTIONARY AND ADVISORY LABELS 15 (Only for use with alcoholic solutions)
- Videne (Ecolab Healthcare Division)
  Povidone-iodine 75 mg per 1 ml Videne 7.5% surgical scrub solution
    - 500 ml £7.67
  Povidone-iodine 100 mg per 1 ml Videne 10% antisepsic solution
    - 500 ml (GSL) £7.67
  Videne 10% alcoholic tincture

ANTISEPTICS AND DISINFECTANTS OTHER

Chlorhexidine

INDICATIONS AND DOSE
CX ANTISEPTIC DUSTING POWDER
For skin disinfection
- TO THE SKIN
- Child: (consult product literature)

CEPTON® LOTION
For skin disinfection in acne
- TO THE SKIN
- Child: (consult product literature)

CEPTON® SKIN WASH
For use as skin wash in acne
- TO THE SKIN
- Child: (consult product literature)

HIBITANE® PLUS 5% CONCENTRATE SOLUTION
General and pre-operative skin disinfection
- TO THE SKIN
- Child: (consult product literature)

HIBISCRAPE®
Pre-operative hand and skin disinfection | General hand and skin disinfection
- TO THE SKIN
- Child: Use as alternative to soap (consult product literature)

HIBITANE OBSTETRIC®
For use in obstetrics and gynaecology as an antiseptic and lubricant
- TO THE SKIN
- Child: To be applied to skin around vulva and perineum and to hands of midwife or doctor

HIBI® LIQUID HAND RUB+
Hand and skin disinfection
- TO THE SKIN
- Child: To be used undiluted (consult product literature)

HYDREX® SOLUTION
For pre-operative skin disinfection
- TO THE SKIN
- Child: (consult product literature)

HYDREX® SURGICAL SCRUB
For pre-operative hand and skin disinfection | General hand disinfection
- TO THE SKIN
- Child: (consult product literature)

UNISEPT®
For cleansing and disinfecting wounds and burns and swabbing in obstetrics
- TO THE SKIN
- Child: (consult product literature)

IMPORTANT SAFETY INFORMATION
In preterm neonates, use sparingly, monitor for skin reactions, and do not allow solution to pool—risk of severe chemical burns.

CONTRA-INDICATIONS
Alcoholic solutions not suitable before diathermy - alcoholic solutions not suitable for use on neonatal skin - not for use in body cavities

CAUTIONS
Avoid contact with brain - avoid contact with eyes - avoid contact with meninges - avoid contact with middle ear

SIDE-EFFECTS
Chemical burns in preterm neonates - sensitivity
### Chlorhexidine with cetrimide

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 732.

#### INDICATIONS AND DOSE

Skin disinfection such as wound cleansing and obstetrics

- TO THE SKIN
- Child: To be used undiluted

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- **Chlorhexidine with cetrimide (Non-proprietary)**
  - Chlorhexidine gluconate 1 mg per 1 gram
  - Cetrimide 5 mg per 1 gram
  - Nursing Plastic £1.50

**Powder**
- **Chlorhexidine with cetrimide (Non-proprietary)**
  - Chlorhexidine acetate 100 microgram per 1 gram
  - Cetrimide 30 microgram per 1 gram
  - Nursing Plastic £0.40

### Diethyl phthalate with methyl salicylate

#### INDICATIONS AND DOSE

Skin preparation before injection

- TO THE SKIN
- Child: Apply to the area to be disinfected

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Liquid**
- **Diethyl phthalate with methyl salicylate (Non-proprietary)**
  - Methyl salicylate 5 ml per 1 litre
  - Diethyl phthalate 20 ml per 1 litre
  - Castor oil 25 ml per 1 litre
  - Industrial methylated spirit 950 ml per 1 litre
  - Surgical spirit
  - 200 ml £1.50
  - 1000 ml £3.62

### Hydrogen peroxide

#### DRUG ACTION

Hydrogen peroxide is an oxidising agent.

#### INDICATIONS AND DOSE

Superficial bacterial skin infection

- TO THE SKIN
- Child: Apply 2–3 times a day for up to 3 weeks

#### UNLICENSED USE

Licensed for use in children (age range not specified by manufacturer).

#### CAUTIONS

Avoid on eyes - avoid on healthy skin - incompatible with products containing iodine or potassium permanganate

#### PRESCRIBING AND DISPENSING INFORMATION

The BP directs that when hydrogen peroxide is prescribed,
hydrogen peroxide bleaches fabric.

**HANDLING AND STORAGE** Hydrogen peroxide bleaches fabric.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**EXCIPIENTS:** May contain Edetic acid (edta), propylene glycol

▶ **Crystacide** (Reig Jofre UK Ltd)

Hydrogen peroxide 10 mg per 1 gram

25 gram £8.07 40 gram £11.62

**INDICATIONS AND DOSE**
Infected wounds | Infected burns

▶ **TO THE SKIN**

▶ **Child:** (consult product literature)

**PATIENT AND CARER ADVICE**
Stains clothing.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

**Irrigation solutions**

**IRRIGATION SOLUTIONS**

Flowfusor sodium chloride 0.9% irrigation solution 120ml bottles (Fresenius Kabi Ltd)

Sodium chloride 9 mg per 1 ml 1 bottle

NHS indicative price = £1.71 - Drug Tariff (Part Ixa)

Steriwash sodium chloride 0.9% irrigation solution 20ml unit dose (Steroplast Healthcare Ltd)

NHS indicative price = £0.57 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irrigation solution 20ml unit dose (Baxter Healthcare Ltd)**

NHS indicative price = £0.45 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irrigation solution 20ml unit dose (Convatec Ltd)**

NHS indicative price = £0.48 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irrigation solution 20ml unit dose (Fresenius Kabi Ltd)**

NHS indicative price = £0.46 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irrigation solution 20ml unit dose (Mylan Ltd)**

NHS indicative price = £0.45 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irrigation solution 20ml unit dose (Mylan Ltd)**

NHS indicative price = £0.45 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irrigation solution 20ml unit dose (Pfizer Ltd)**

NHS indicative price = £0.45 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irrigation solution 20ml unit dose (Pfizer Ltd)**

NHS indicative price = £0.45 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irrigation solution 20ml unit dose (Pfizer Ltd)**

NHS indicative price = £0.45 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irritation solution 20ml unit dose (Alissa Healthcare Research Ltd)**

Sodium chloride 9 mg per 1 ml 25 unit dose

NHS indicative price = £7.36 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irritation solution 20ml unit dose (Crest Medical Ltd)**

Sodium chloride 9 mg per 1 ml 25 unit dose

NHS indicative price = £7.92 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irritation solution 20ml unit dose (Mylan Ltd)**

Sodium chloride 9 mg per 1 ml 25 unit dose

NHS indicative price = £5.50 - Drug Tariff (Part Ixa)

**Sodium chloride 0.9% irritation solution aerosol spray (C D Medical Ltd)**

Sodium chloride 9 mg per 1 ml 100 ml

NHS indicative price = £2.07 - Drug Tariff (Part Ixa)

8.1 Minor cuts and abrasions

**Minor cuts and abrasions**

**Management**

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided.

Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils as these are best treated with antibiotics.

Cetrimide is used to treat minor cuts and abrasions and proflavine above may be used to treat infected wounds or burns, but its use has now been largely superseded by other antiseptics or suitable antibacterials. The effervescent effect of hydrogen peroxide p. 733 is used to clean minor cuts and abrasions.

Flexible collodion (see castor oil with collodion and colophony below) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

**Dermatological Drugs**

**Colloids**

**Castor oil with collodion and colophony**

**INDICATIONS AND DOSE**
Used to seal minor cuts and wounds that have partially healed

▶ **TO THE SKIN**

▶ **Child:** (consult product literature)

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has an allergy to colophony in elastic adhesive plasters and tape.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

▶ **Castor oil with collodion and colophony (Non-proprietary)**

Castor oil 25 mg per 1 ml, Colophony 25 mg per 1 ml

Colloidiend methylated 950 microlitre per 1 ml

Flexible collodion methylated

100 ml £13.54 | 500 ml £27.79

**Skin adhesives**

**SKIN ADHESIVES**

**DermaFlex skin adhesive** (Chemence Ltd)

0.5 ml - NHS indicative price = £5.36 - Drug Tariff (Part Ixa)

**Dermabond ProPen skin adhesive** (Ethicon Ltd)

0.5 ml - NHS indicative price = £9.46 - Drug Tariff (Part Ixa)

**Histoacryl L skin adhesive** (B.Braun Medical Ltd)

0.5 ml - NHS indicative price = £6.72 - Drug Tariff (Part Ixa)
9 Skin disfigurement

Camouflagers

Overview
Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances
The preparations marked ‘ACBS’ can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.

Camouflages

- **CAMOUFLAGES**
  - **Covermark classic foundation** (Derma UK Ltd)
    15 ml(ACBS) - NHS indicative price = £11.86
  - **Covermark finishing powder** (Derma UK Ltd)
    25 gram(ACBS) - NHS indicative price = £11.86
  - **Dermablend Dermasmooth Corrective Foundation** (Vichy)
    30 ml - No NHS indicative price available
  - **Dermacol colour camouflage** (Kryolan UK Ltd)
    50 ml - NHS indicative price = £8.94
  - **Dermacol camouflage creme** (Kryolan UK Ltd)
    30 gram - NHS indicative price = £11.00
  - **Dermacol fixing powder** (Kryolan UK Ltd)
    60 gram(ACBS) - NHS indicative price = £9.85
  - **Keromask finishing powder** (Bellava Ltd)
    20 gram(ACBS) - NHS indicative price = £5.80
  - **Keromask masking cream** (Bellava Ltd)
    15 ml(ACBS) - NHS indicative price = £5.90
  - **Veil cover cream** (Thomas Blake Cosmetic Creations Ltd)
    19 gram(ACBS) - NHS indicative price = £22.42
  - **Veil finishing powder** (Thomas Blake Cosmetic Creations Ltd)
    35 gram(ACBS) - NHS indicative price = £24.58

10 Sun protection and photodamage

Photodamage

Overview
Actinic keratoses occur very rarely in healthy children; actinic cheilitis may occur on the lips of adolescents following excessive sun exposure.

Dichlofenac gel (Solaraze) and topical preparations of fluorouracil are licensed for the treatment of actinic keratoses but they are not licensed for use in children.

In children with photosensitivity disorders, such as erythropoietic protoporphyria, specialists may use betacarotene p. 736, mepacrine, chloroquine or hydroxychloroquine to reduce skin reactions.

Sunscreen

Sunscreen preparations
Solar ultraviolet irradiation can be harmful to the skin. It is responsible for disorders such as polymorphic light eruption, solar urticaria, and it provokes the various cutaneous porphyrias. It also provokes (or at least aggravates) skin lesions of lupus erythematosus and may aggravate some other dermatoses. Certain drugs, such as demeclocycline, phenothiazines, or amiodarone, can cause photosensitivity. All these conditions (as well as sunburn) may occur after relatively short periods of exposure to the sun. Solar ultraviolet irradiation may provoke attacks of recurrent herpes labialis (but it is not known whether the effect of sunlight exposure is local or systemic).

The effects of exposure over longer periods include ageing changes and more importantly the initiation of skin cancer.

Solar ultraviolet radiation is approximately 200–400 m in wavelength. The medium wavelengths (290–320 nm, known as UBV) cause sunburn. The long wavelengths (320–400 nm, known as UVA) are responsible for many photosensitivity reactions and photodermatoses. Both UVA and UVB contribute to long-term photodamage and to the changes responsible for skin cancer and ageing.

Sunscreen preparations contain substances that protect the skin against UVA and UVB radiation, but they are no substitute for covering the skin and avoiding sunlight. Protective clothing and sun avoidance (rather than the use of sunscreen preparations) are recommended for children under 6 months of age.

The sun protection factor (SPF, usually indicated in the preparation title) provides guidance on the degree of protection offered against UBV; it indicates the multiples of protection provided against burning, compared with unprotected skin; for example, an SPF of 8 should enable a child to remain 8 times longer in the sun without burning. However, in practice users do not apply sufficient sunscreen and the protection is lower than that found in experimental studies. Some manufacturers use a star rating system to indicate the protection against UVA relative to protection against UBV for sunscreen products. However, the usefulness of the star rating system remains controversial. The EU Commission (September 2006) has recommended that the UVA protection factor for a sunscreen should be at least one-third of the sun protection factor (SPF); products that achieve this requirement will be labelled with a UVA logo alongside the SPF classification.

Preparations that also contain reflective substances, such as titanium dioxide, provide the most effective protection against UVA.

Histoacryl skin adhesive (B. Braun Medical Ltd)
  .5 ml - NHS indicative price = £6.50 - Drug Tariff (Part IXa)

Indermil skin adhesive (Covidien (UK) Commercial Ltd)
  .5 gram - NHS indicative price = £6.50 - Drug Tariff (Part IXa)

LiquiBand flow control tissue adhesive (MedLogic Global Ltd)
  .5 gram - NHS indicative price = £5.50 - Drug Tariff (Part IXa)

LiquiBand tissue adhesive (MedLogic Global Ltd)
  .5 gram - NHS indicative price = £5.50 - Drug Tariff (Part IXa)
Sunscreen preparations may rarely cause allergic reactions. For optimum photoprotection, sunscreen preparations should be applied thickly and frequently (approximately 2 hourly). In photodermatoses, they should be used from spring to autumn. As maximum protection from sunlight is desirable, preparations with the highest SPF should be prescribed.

### Ingredient nomenclature in sunscreen preparations

The European Commission Cosmetic Products Regulation (EC) 1223/2009 requires the use of INCI (International Nomenclature of Cosmetic Ingredients) for cosmetics and sunscreens. This table includes the rINN and the INCI synonym for the active ingredients of sunscreen preparations in the BNFC.

### Borderline substances

Anthelios® XL SPF 50+ Melt-in cream; Sunsense® Ultra; Uvistat® Lipscreen SPF 50; and Uvistat® Suncream SPF 30 and 50 (see Borderline substances) cannot be prescribed on the NHS except for skin protection against ultraviolet radiation in abnormal cutaneous photosensitivity resulting from genetic disorders or photodermatoses, including vitiligo and those resulting from radiotherapy; chronic or recurrent herpes simplex labialis. Preparations with SPF less than 30 should not normally be prescribed.

### VITAMINS AND TRACE ELEMENTS

#### Betacarotene

**Drug action** Betacarotene is a precursor to vitamin A.

**Indications and dose**

Management of photosensitivity reactions in erythropoietic protoporphyria (specialist use only)

- **By mouth**
  - Child 1-4 years: 60–90 mg daily, to be given as a single dose or in divided doses
  - Child 5-8 years: 90–120 mg daily, to be given as a single dose or in divided doses
  - Child 9-11 years: 120–150 mg daily, to be given as a single dose or in divided doses
  - Child 12-15 years: 150–180 mg daily, to be given as a single dose or in divided doses
  - Child 16-17 years: 180–300 mg daily, to be given as a single dose or in divided doses

**Unlicensed use** Not licensed.

**Cautions** Monitor vitamin A intake

### CAUTIONS, FURTHER INFORMATION

Protection not total—avoid strong sunlight and use sunscreen preparations; generally 2–6 weeks of treatment (resulting in yellow coloration of palms and soles) necessary before increasing exposure to sunlight; dose should be adjusted according to level of exposure to sunlight.

- **Side-effects**
  - Rare Arthralgia - bruising
  - Frequency not known Loose stools - yellow discoloration of skin

- **Pregnancy** Partially converted to vitamin A, but does not give rise to abnormally high serum concentration; manufacturer advises use only if potential benefit outweighs risk.

- **Breast Feeding** Use with caution—present in milk.

- **Hepatic Impairment** Avoid.

- **Renal Impairment** Use with caution.

- **Medicinal forms**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule

  **Capsule**
  **Cautionary and advisory labels 21**
  - Betacarotene (Non-proprietary)
    - Betacarotene 15 mg Betacarotene 15mg capsules | 90 capsule £6.11
    - G & G Natural Betacarotene 15mg capsules | 120 capsule £13.50
  - Betacarotene 25 mg Carotaben 25mg capsules | 100 capsule £ no price available
  - Lumiteine 30mg capsules | 100 capsule £ no price available
  - Bio-Caroteino (Pharma Nord (UK) Ltd)
    - Betacarotene 9 mg Bio-Caroteino 9mg capsules | 150 capsule £ no price available
  - Super Betavit (Health+Plus Ltd)
    - Betacarotene 15 mg Super Betavit 15mg capsules | 30 capsule £3.59

### 11 Superficial soft-tissue injuries and superficial thrombophlebitis

#### Topical circulatory preparations

**Overview**

These preparations are used to improve circulation in conditions such as bruising and superficial thrombophlebitis but are of little value. First aid measures such as rest, ice, compression, and elevation should be used. Chiliplains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

#### Heparinoids

**Heparinoid**

**Indications and dose**

Superficial thrombophlebitis | Bruising | Haematoma

- **To the skin**
  - Child 5-17 years: Apply up to 4 times a day

**Contra-indications** Should not be used on large areas of skin, broken or sensitive skin, or mucous membranes

**Less suitable for prescribing** Hirudoid® is less suitable for prescribing.
12 Warts and calluses

Warts and calluses

Overview

Warts (verruca vulgaris) are common, benign, self-limiting, and usually asymptomatic. They are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction and is required only if the warts are painful, unsightly, persistent, or cause distress. In immunocompromised children, warts may be more difficult to eradicate.

Preparations of salicylic acid p. 739, formaldehyde below, glutaraldehyde p. 738 or silver nitrate p. 738 are used for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line in the treatment of warts; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation; collodion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

Anogenital warts

Anogenital warts (condylomata acuminata) in children are often asymptomatic and require only a simple barrier preparation. If treatment is required it should be supervised by a hospital specialist. Persistent warts on genital skin may require treatment with cryotherapy or other forms of physical ablation under general anaesthesia.

Podophyllotoxin below (the major active ingredient of podophyllum), or imiquimod p. 898 are used to treat external anogenital warts; these preparations can cause considerable irritation of the treated area and are therefore suitable only for children who are able to co-operate with the treatment.

ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS

Podophyllotoxin

● INDICATIONS AND DOSE

CONDYLONE®

Condylomata acuminata affecting the penis or the female external genitalia

► TO THE LESION
► Child 2-17 years (initiated under specialist supervision): Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm² in the male, maximum 50 single applications (‘loops’) per session (consult product literature)

WARTICON® CREAM

Condylomata acuminata affecting the penis or the female external genitalia

► TO THE LESION
► Child 2-17 years (initiated under specialist supervision): Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm²

WARTICON® LIQUID

Condylomata acuminata affecting the penis or the female external genitalia

► TO THE LESION
► Child 2-17 years (initiated under specialist supervision): Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm², maximum 50 single applications (‘loops’) per session (consult product literature)

● UNLICENSED USE Not licensed for use in children.

● CAUTIONS Avoid normal skin, avoid open wounds, keep away from face, very irritable to eyes

● SIDE-EFFECTS Local irritation

● PREGNANCY Avoid.

● BREAST FEEDING Avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including ceteryl and stearyl alcohol), hydroxybenzoates (parabens)
► Hirudoid (Genus Pharmaceuticals Ltd)
   Podophyllotoxin 5 mg per 1 ml Podophyllotoxin 0.15% cream | 5 gram POM £15.83 DT price = £17.83

Gel

EXCIPIENTS: May contain Fragrances, propylene glycol
► Hirudoid (Genus Pharmaceuticals Ltd)
   Podophyllotoxin 3 mg per 1 gram Hirudoid 0.3% gel | 50 gram POM £3.99
   DT price = £3.99

Formaldehyde

● INDICATIONS AND DOSE

Warts, particularly plantar warts
► TO THE LESION
► Child: Apply twice daily

● UNLICENSED USE Licensed for use in children (age range not specified by manufacturer).

● CAUTIONS Impaired peripheral circulation, not suitable for application to anogenital region, not suitable for application to face, not suitable for application to large areas, patients with diabetes at risk of neuropathic ulcers, protect surrounding skin and avoid broken skin, significant peripheral neuropathy

● SIDE-EFFECTS Skin irritation, skin ulceration (with high concentrations)

ANTISEPTICS AND DISINFECTANTS > ALDEHYDES AND DERIVATIVES

Formaldehyde

● INDICATIONS AND DOSE

Warts, particularly plantar warts
► TO THE LESION
► Child: Apply twice daily

● UNLICENSED USE Licensed for use in children (age range not specified by manufacturer).

● CAUTIONS Impaired peripheral circulation, not suitable for application to anogenital region, not suitable for application to face, not suitable for application to large areas, patients with diabetes at risk of neuropathic ulcers, protect surrounding skin and avoid broken skin, significant peripheral neuropathy

● SIDE-EFFECTS Skin irritation, skin ulceration (with high concentrations)
Patient and Carer Advice
Patients should be advised that silver nitrate may stain fabric.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Stick

- Silver nitrate (Non-proprietary)
  - Silver nitrate 400 mg per 1 gram Silver nitrate 40% caustic pencils
    - 1 applicator [£] no price available
  - Avoca (Bray Group Ltd)
    - Silver nitrate 400 mg per 1 gram Avoca 40% silver nitrate pencils
      - 1 applicator [£] £1.03
    - Silver nitrate 750 mg per 1 gram Avoca 75% silver nitrate applicators
      - 100 applicator [£] £44.48
      - Avoca 75% silver nitrate applicators with thick handles
        - 50 applicator [£] £43.41
    - Silver nitrate 950 mg per 1 gram Avoca 95% silver nitrate applicators
      - 100 applicator [£] £44.52
      - Avoca 95% silver nitrate pencils
        - 1 applicator [£] £1.99 DT price = £2.44
      - Avoca wart and verruca treatment set
        - 1 applicator [£] £2.44 DT price = £2.44

ANTIVIRALS

Imiquimod

- Indications and Dose

**ALDARA**

- Warts (external genital and perianal)
  - To the lesion
  - Child (initiated under specialist supervision): Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night

- Unlicensed Use

**ALDARA**

- Not licensed for use in children.

- Cautions

  - Autoimmune disease - avoid broken skin - avoid normal skin - avoid open wounds - immunosuppressed patients - not suitable for internal genital warts - uncircumcised males (risk of phimosis or stricture of foreskin)

- Side-Effects

  - Common or very common Burning sensation - erosion - erythema - excoriation - headache - influenza-like symptoms - itching - local reactions - myalgia - oedema - scabbing
  - Uncommon Alopecia - local ulceration
  - Rare Cutaneous lupus erythematosus-like effect - Stevens-Johnson syndrome
  - Very rare Dysuria
  - Frequency not known Permanent hyperpigmentation - permanent hypopigmentation

- Conception and Contraception

  - May damage latex condoms and diaphragms.

- Pregnancy

  - No evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution.

- Breast Feeding

  - No information available.

- Directions for Administration

**ALDARA**

- Important Should be rubbed in and allowed to stay on the treated area for 6–10 hours then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

- Patient and Carer Advice

  - A patient information leaflet should be provided.
Salicylic acid with lactic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, salicylic acid, above.

**INDICATIONS AND DOSE**

**CUPLEX®**

Plantar and mosaic warts | Corns | Calluses

▶ TO THE LESION
▶ Child: Apply twice daily, treatment may need to be continued for up to 3 months

**EXCIPIENTS:**
- Water
- Lactic acid 40 mg per 1 gram, Salicylic acid 110 mg per gram
- Disodium hydrogen phosphate (E332)
- Glycerol monostearate (E458)
- Polyethylene glycol 6000
- Colophony (E553.1a)
- Methyl parahydroxybenzoate (E218)
- Propyl parahydroxybenzoate (E219)
- Sorbic acid (E200)
- Carbomer
- Benzyl alcohol (E120)
- Methylparaben (E219)
- Propylparaben (E218)
- Benzyl alcohol (E120)
- Glycerol (E321)
- Water

**DIRECTIONS FOR USE**

 Apply twice daily, treatment may need to be continued for up to 3 months.
1 Immunoglobulin therapy

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Immunoglobulins

Passive immunity

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antiserum, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 743 and disease-specific immunoglobulins.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK, tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult www.ivig.nhs.uk and Clinical Guidelines for Immunoglobulin Use, www.gov.uk/dh.

Further information on the use of immunoglobulins is included in Public Health England’s Immunoglobulin Handbook www.gov.uk/phe, and in the Department of Health’s publication, Immunisation against Infectious Disease, www.gov.uk/dh.

Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 745 which is available from BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 745 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 743 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the Scottish National Blood Transfusion Service (SNBTS).

In Wales all immunoglobulins are available from the Welsh Blood Service (WBS).

In Northern Ireland all immunoglobulins are available from the Northern Ireland Blood Transfusion Service (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin (‘HNIG’) is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin (containing 10–18% protein) is administered by intramuscular injection for the protection of susceptible contacts against hepatitis A virus (infectious hepatitis), measles and, to a lesser extent, rubella. Injection of immunoglobulin produces immediate protection lasting for several weeks.

Normal immunoglobulin (containing 3–12% protein) for intravenous administration is used as replacement therapy for children with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred. Intravenous immunoglobulin is also used in the treatment of Guillain–Barre syndrome as an alternative to plasma exchange.

The dose of normal immunoglobulin used as replacement therapy in patients with immunodeficiencies is not the same as the dose required for treatment of acute conditions. For Kawasaki disease a single dose by intravenous infusion should be given with concomitant aspirin p. 89 within 10 days of onset of symptoms (but children with a delayed diagnosis may also benefit).

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for other conditions, consult Clinical Guidelines for Immunoglobulin Use (www.gov.uk/dh).

Hepatitis A

Hepatitis A vaccine p. 764 is preferred for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and Western Europe, North America, Japan, Australia, and New
Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

**Measles**

Intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- non-immune pregnant women
- infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. 020 8200 6868).

Individuals with normal immunity who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 769 for prophylaxis following exposure to measles.

**Rubella**

Intramuscular normal immunoglobulin after exposure to rubella does **not** prevent infection in non-immune contacts and is **not** recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin p. 743 should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 769.

**Disease-specific immunoglobulins**

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.gov.uk/phe).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as postexposure prophylaxis.

**Hepatitis B immunoglobulin**

Disease-specific hepatitis B immunoglobulin (‘HBIG’) p. 743 is available for use in association with hepatitis B vaccine p. 765 for the prevention of infection in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see hepatitis B vaccine). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

**Rabies immunoglobulin**

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soapy water and specific rabies immunoglobulin p. 745 of human origin administered. All of the dose should be injected around the site of the wound; if this is difficult or the wound has completely healed it can be given in the anterolateral thigh (remote from the site used for vaccination). Rabies vaccine p. 770 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

**Tetanus immunoglobulin**

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 745 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 319 and wound cleansing, should also be used for the treatment of established cases of tetanus.

**Varicella-zoster immunoglobulin**

Varicella-zoster immunoglobulin (VZIG) p. 746 is recommended for individuals who are at increased risk of severe varicella and who have no antibodies to varicella-zoster virus and who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- susceptible neonates exposed in the first 7 days of life;
- susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks’ gestation or to those near term) providing VZIG is given within 10 days of contact;
- immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone; children 2 mg/kg daily (or more than 40 mg) for at least 1 week or 1 mg/kg daily for 1 month.

**Important:** for full details consult Immunisation against Infectious Disease. Varicella-zoster vaccine p. 771 is available.

---

**Anti-D (Rh0) immunoglobulin**

- **INDICATIONS AND DOSE**
  - To rhesus-negative woman for prevention of Rh(D) sensitisation, following birth of rhesus-positive infant
    - **by deep intramuscular injection**
    - Females of childbearing potential: 500 units, dose to be administered immediately or within 72 hours; for transplacental bleed of over 4 ml fetal red cells, extra 100–125 units per ml fetal red cells, subcutaneous route used for patients with bleeding disorders
To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks’ gestation

- BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks’ gestation

- BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, antenatal prophylaxis

- BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 500 units per episode, dose to be given at weeks 28 and 34 of pregnancy, if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, antenatal prophylaxis (alternative NICE recommendation)

- BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, dose to be given between 28 and 30 weeks gestation

To rhesus-negative woman for prevention of Rh(D) sensitisation, following Rh(D) incompatible blood transfusion

- BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders

RHOPHYLAC®

To rhesus-negative woman for prevention of Rh(D) sensitisation, following birth of rhesus-positive infant

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Females of childbearing potential: 1000–1500 units, dose to be administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks’ gestation

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

To rhesus-negative woman for prevention of Rh(D) sensitisation, antenatal prophylaxis

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following Rh(D) incompatible blood transfusion

- BY INTRAVENOUS INJECTION
- Females of childbearing potential: 50 units per mL of transfused rhesus-positive blood, alternatively 100 units per mL of erythrocyte concentrate, intravenous route recommended for patients with bleeding disorders

- CONTRA-INDICATIONS Treatment of idiopathic thrombocytopenia purpura in rhesus negative patients · treatment of idiopathic thrombocytopenia purpura in splenectomised patients

- CAUTIONS Immunoglobulin A deficiency · possible interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION

- MMR vaccine MMR vaccine may be given in the postpartum period with anti-D (Rh(D)) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Rare Anaphylaxis · dyspnoea · hypotension · tachycardia · urticaaria
- Frequency not known Abdominal pain · arthralgia · asthenia · back pain · diarrhoea · dizziness · drowsiness · fever · headache · hypertension · hypotension · injection site pain · malaise · myalgia · nausea · pruritus · rash · sweating · vomiting

SPECIFIC SIDE-EFFECTS

- With intravenous use Abdominal distension · blood pressure fluctuations · deep vein thrombosis · haemolytic anaemia · injection site reactions · myocardial infarction · pulmonary embolism · stroke · thromboembolic events

HANDLING AND STORAGE Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156 Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative. www.nice.org.uk/TA156

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- D-Gam (Bio Products Laboratory Ltd)
  - Anti-D (RHO) immunoglobulin 500 unit D-Gam Anti-D immunoglobulin 500 unit solution for injection vials | 1 vial £33.75
  - Anti-D (RHO) immunoglobulin 1500 unit D-Gam Anti-D immunoglobulin 1,500 unit solution for injection vials | 1 vial £58.00
Hepatitis B immunoglobulin

**INDICATIONS AND DOSE**

**Prophylaxis against hepatitis B infection**

- **By intramuscular injection**
  - Neonate: 200 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.
  - Child 1 month–4 years: 200 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.
  - Child 5–9 years: 300 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.
  - Child 10–17 years: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.

**Prevention of transmitted infection at birth**

- **By intramuscular injection**
  - Neonate: 200 units, dose to be administered as soon as possible after birth; for full details consult Immunisation against Infectious Disease (www.dh.gov.uk).

**By intravenous infusion**

- Neonate: (consult product literature).

**Prophylaxis against hepatitis B infection, after exposure to hepatitis B virus-contaminated material**

- **By intravenous infusion**
  - Child: Dose to be administered as soon as possible after exposure, but no later than 72 hours (consult product literature).

**Prophylaxis against re-infection of transplanted liver**

- **By intravenous infusion**
  - Child: (consult product literature).

**CAUTIONS**

- IgA deficiency · interference with live virus vaccines

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Rare: Anaphylaxis · chest tightness · dyspnoea
- Frequency not known: Arthralgia · buccal ulceration · dizziness · facial oedema · glossitis · pain at injection site · swelling at injection site · tremor

**SPECIFIC SIDE-EFFECTS**

- With intravenous use: Abdominal distension · abdominal pain · blood pressure fluctuations · deep vein thrombosis · haemolytic anaemia · injection site reactions · myocardial infarction · pulmonary embolism · stroke · thromboembolic events

**PRESCRIBING AND DISPENSING INFORMATION**

Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.

**HANDLING AND STORAGE**

Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Hepatitis B immunoglobulin (Non-proprietary)**
  - Hepatitis B immunoglobulin human 200 unit · Hepatitis B immunoglobulin human 200 unit solution for injection vials 1 vial (£50.00)
  - Hepatitis B immunoglobulin human 500 unit · Hepatitis B immunoglobulin human 500 unit solution for injection vials 1 vial (£30.00)
  - Zutectra (Biotest (UK) Ltd) Zutectra 500 units/vial solution for injection pre-filled vials 5 vials (£1.275.00)

**Solution for infusion**

- **Hepatect CP** (Biotest (UK) Ltd) Hepatect CP human 50 unit per 1 ml Hepatect CP units/vial 50 unit solution for infusion vials 1 vial (£935.00)
  - Hepatect CP 50 units/10ml solution for infusion vials 1 vial (£25.00)
  - Hepatect CP 500 units/10ml solution for infusion vials 1 vial (£2.337.50)

- **Omri-Hep-B** (Imported (Israel)) Hepatitis B immunoglobulin human 50 unit per 1 ml Omri-Hep-B 500 units/100ml solution for infusion vials 1 vial no price available

**Normal Immunoglobulin**

**INDICATIONS AND DOSE**

**To control outbreaks of hepatitis A**

- **By deep intramuscular injection**
  - Child 1 month–9 years: 250 mg
  - Child 10–17 years: 500 mg

**Rubella in pregnancy, prevention of clinical attack**

- **By deep intramuscular injection**
  - Females of childbearing potential: 750 mg

**Antibody deficiency syndromes**

- **By subcutaneous infusion**
  - Child: (consult product literature)

**Kawasaki disease (with concomitant aspirin)**

- **By intravenous infusion**
  - Child: 2 g/kg daily for 1 dose, treatment should be given within 10 days of onset of symptom (but children with a delayed diagnosis may also benefit)

**SUBGAM®**

**Hepatitis A prophylaxis in outbreaks**

- **By intramuscular injection**
  - Child 1 month–9 years: 500 mg
  - Child 10–17 years: 750 mg

**UNLICENSED USE**

**SUBGAM®** Subgam® is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

**CONTRA-INDICATIONS**

Patients with selective IgA deficiency who have known antibody against IgA

**HIZENTRA®**

**Hyperprolinaemia (contains -proline)**

**FLEBOGAMMA® DIF**

**Hereditary fructose intolerance (contains sorbitol)**

**PRIVIGEN®**

**Hyperprolinaemia (contains -proline)**

**GAMMAPLEX®**

**Hereditary fructose intolerance (contains sorbitol)**
**Cautions**

**General Cautions**
Agammaglobulinaemia with or without IgA deficiency · hypogammaglobulinaemia with or without IgA deficiency · interference with live virus vaccines

**Specific Cautions**
- With intravenous use Ensure adequate hydration · obesity · renal insufficiency · risk factors for arterial or venous thromboembolic events · thrombophilic disorders

**Caution, Further Information**
- Interference with live virus vaccines. Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

**Octagam**® Falsely elevated results with blood glucose testing systems (contains maltose)

**Side-Effects**

**General Side-Effects**
- Rare: Acute renal failure · anaphylaxis · aseptic meningitis · cutaneous skin reactions · hypotension
- Frequency not known: Arthralgia · chills · diarrhoea · dizziness · fever · headache · low back pain · muscle spasms · myalgia · nausea

**Specific Side-Effects**
- With intravenous use: Abdominal distension · abdominal pain · blood pressure fluctuations · deep vein thrombosis · haemolytic anaemia · injection site reactions · myocardial infarction · pulmonary embolism · stroke · thromboembolic events

**Side-Effects, Further Information**
Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

**Monitoring Requirements**
Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

**Directions for Administration**
Preparations for subcutaneous use: May be administered by intramuscular injection if subcutaneous route not possible; intramuscular route not for patients with thrombocytopenia or other bleeding disorders.

**Gamunex**® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

**Kiovig**® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

**Prescribing and Dispensing Information**
Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers—formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.
- With intramuscular use: Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).

**Handling and Storage**
Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Reifergerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for Injection**

**Electrolytes:** May contain Sodium

Side-effects

Rare: Anaphylaxis, arthralgia, buccal ulceration, chest tightness, dizziness, dysphonia, glossitis, tremor

Frequency not known: Facial oedema, injection site pain, injection site swelling

Prescribing and dispensing information

The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose.

Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

Handling and storage

Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Rabies immunoglobulin (Non-proprietary)
Rabies immunoglobulin human 500 unit Rabies immunoglobulin human 500 unit solution for injection vials | 1 vial (Pom) £600.00

Tetanus immunoglobulin

Indications and dose

Post-exposure prophylaxis

By intramuscular injection

Child: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns

Treatment of tetanus infection

By intramuscular injection

Child: 150 units/kg, dose may be given over multiple sites

Caution

IgA deficiency • interference with live virus vaccines

Side-effects

Rare: Anaphylaxis, arthralgia, buccal ulceration, chest tightness, dizziness, dysphonia, glossitis, tremor

Frequency not known: Facial oedema, injection site swelling, pain at injection site

Rabies immunoglobulin

Indications and dose

Post-exposure prophylaxis against rabies infection

By local infiltration, or by intramuscular injection

Child: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

Caution

IgA deficiency • interference with live virus vaccines
Varicella-zoster immunoglobulin
(Antivaricella-zoster Immunoglobulin)

- **INDICATIONS AND DOSE**
  - Prophylaxis against varicella infection
    - **BY DEEP INTRAMUSCULAR INJECTION**
      - Neonate: 250 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.
      - Child 1 month–5 years: 250 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.
      - Child 6–10 years: 500 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.
      - Child 11–14 years: 750 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.
      - Child 15–17 years: 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.

- **CAUTIONS** IgA deficiency · interference with live virus vaccines
- **SIDE-EFFECTS**
  - Rare  Anaphylaxis
  - Frequency not known  Injection site pain · injection site swelling
- **DIRECTIONS FOR ADMINISTRATION** Normal immunoglobulin for intravenous use may be used in those unable to receive intramuscular injections.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Available from selected Public Health England and NHS laboratories (also from BPL).

IMMUNE SERAS AND IMMUNOGLOBULINS

ANTITOXINS

Botulism antitoxin

- **DRUG ACTION** A preparation containing the specific antitoxic globulins that have the power of neutralising the toxins formed by types A, B, and E of Clostridium botulinum.
- **INDICATIONS AND DOSE**
  - Post exposure prophylaxis of botulism
    - **BY INTRAMUSCULAR INJECTION**
    - Child: (consult product literature)
    - Adult: Dose should be given without waiting for bacteriological confirmation (consult product literature)

- **SIDE-EFFECTS**
  - Hypersensitivity reactions

- **CAUTIONS, FURTHER INFORMATION**
  - Hypersensitivity
    - Hypersensitivity is common after administration; resuscitation facilities should be available.
    - Diphtheria antitoxin is no longer used for prophylaxis because of the risk of hypersensitivity; unimmunised contacts should be promptly investigated and given antibacterial prophylaxis and vaccine.

- **SIDE-EFFECTS**
  - Common or very common

- **PRE-TREATMENT SCREENING**
  - Botulinum antitoxin is not used because the preparation currently in use may have a different specification.

Diphtheria antitoxin

(Dip/Ser)

- **INDICATIONS AND DOSE**
  - Passive immunisation in suspected cases of diphtheria
    - **BY INTRAVENOUS INFUSION**
    - Child: Dose should be given without waiting for bacteriological confirmation (consult product literature)

- **CAUTIONS, FURTHER INFORMATION**
  - Hypersensitivity
    - Hypersensitivity is common after administration; resuscitation facilities should be available.
    - Antitoxin globulins that have the power of neutralising the toxins formed by types A, B, and E of Clostridium diphtheriae.

- **SIDE-EFFECTS**
  - Common or very common

Mantoux test

Available child

CAUTIONS

DIAGNOSTIC AGENTS

Tuberculin purified protein derivative (Tuberculin PPD)

INDICATIONS AND DOSE

Mantoux test

BY INTRADERMAL INJECTION

Child: 2 units for one dose

Mantoux test (if first test is negative and a further test is considered appropriate)

BY INTRADERMAL INJECTION

Child: 10 units for one dose

DOSE EQUIVALENCE AND CONVERSION

2 units is equivalent to 0.1 mL of 20 units/mL strength.

10 units is equivalent to 0.1 mL of 100 units/mL strength.

CAUTIONS

Response to tuberculin may be suppressed by viral infection, sarcoidosis, corticosteroid therapy, or immunosuppression due to disease or treatment and the MMR vaccine. If a tuberculin skin test has already been initiated, then the MMR should be delayed until the skin test has been read unless protection against measles is required urgently. If a child has had a recent MMR, and requires a tuberculin test, then a 4 week interval should be observed. Apart from tuberculin and MMR, all other live vaccines can be administered at any time before or after tuberculin.

PRESCRIBING AND DISPENSING INFORMATION

Available from ImmForm (SSI brand).

The strength of tuberculin PPD in currently available products may be different to the strengths of products used previously for the Mantoux test; care is required to select the correct strength.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

Tuberculin purified protein derivative (Non-proprietary)

1 mL Tuberculin PPD RT 23 SSI 10 tuberculin units/mL solution for injection 1.5mL vials | 1 vial no price available

100 tuberculin unit per 1 mL Tuberculin PPD RT 23 SSI 100 tuberculin units/mL solution for injection 1.5mL vials | 1 vial no price available

3 Tuberculosis diagnostic test

Vaccines

Active immunity

Active immunity can be acquired by natural disease or by vaccination. Vaccines stimulate production of antibodies and other components of the immune mechanism; they consist of either:

- a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
- detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
- extracts of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice reflects that in the handbook Immunisation against Infectious Disease (2013), which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Chapters from the handbook (including updates since 2013) are available at www.gov.uk/government/collections/immunisation-against-infectious-disease-the-green-book.

The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Children with unknown or incomplete immunisation history

For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administered where the routine childhood immunisation schedule has not been completed.

Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from local health organisations or from ImmForm (www.immform.dh.gov.uk)—not to be prescribed on FP10 (HS21 in Northern Ireland; GP 20 in Scotland; WP 10 in Wales).

For the most up to date immunisation schedule consult 'The complete routine immunisation schedule', available at www.gov.uk.

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks postmenstrual age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48–72 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion
Routine immunisation schedule

<table>
<thead>
<tr>
<th>When to immunise (for preterm infants—see note below)</th>
<th>Vaccine given and dose schedule (for details of dose, see under individual vaccines)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neonates at risk only (see BCG vaccine and Hepatitis B vaccine, below)</td>
<td>▶ Bacillus Calmette-Guérin vaccine p. 760 ▶ Hepatitis B vaccine p. 765</td>
</tr>
<tr>
<td>2 months</td>
<td>▶ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 759 First dose ▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 762 First dose ▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 763 First dose ▶ Rotavirus vaccine p. 770 First dose</td>
</tr>
<tr>
<td>3 months</td>
<td>▶ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 759 Second dose ▶ Rotavirus vaccine p. 770 Second dose</td>
</tr>
<tr>
<td>4 months</td>
<td>▶ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 759 Third dose ▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 762 Second dose ▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 763 Second dose</td>
</tr>
<tr>
<td>12-13 months</td>
<td>▶ Measles, mumps and rubella vaccine, live p. 769 First dose ▶ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 762 Single booster dose ▶ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 763 Single booster dose ▶ Haemophilus influenzae type B with meningococcal group C vaccine p. 761 Single booster dose</td>
</tr>
<tr>
<td>2-8 years (including children in school years 1, 2, 3 and 4)</td>
<td>▶ Influenza vaccine p. 767 Each year from September. Note: Flu nasal spray is recommended (Fluenz Tetra®). If contra-indicated and child is in clinical risk group, use inactivated flu vaccine</td>
</tr>
<tr>
<td>Between 3 years and 4 months, and 5 years</td>
<td>▶ Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 759 Single booster dose. Note: Preferably allow interval of at least 3 years after completing primary course ▶ Measles, mumps and rubella vaccine, live p. 769 Second dose</td>
</tr>
<tr>
<td>11-14 years (females only). First dose of HPV vaccine will be offered to females aged 12-13 years of age in England, Wales, and Northern Ireland, and 11-13 years of age in Scotland.</td>
<td>▶ Human papillomavirus vaccines p. 767 Two doses; second dose 6-24 months after first dose. If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed (2 doses less than 6 months apart does not provide long-term protection). The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, since 2012, only Gardasil® is offered as part of the national immunisation programme; for those females who started the schedule with Cervarix® under the national immunisation programme, but did not complete the vaccination course, the course can be completed with Gardasil®.</td>
</tr>
<tr>
<td>13-15 years</td>
<td>▶ Meningococcal groups A with C and W135 and Y vaccine p. 762 Single booster dose</td>
</tr>
<tr>
<td>13-18 years</td>
<td>▶ Diphtheria with poliomyelitis and tetanus vaccine p. 760 Single booster dose. Note: Can be given at the same time as the booster dose of meningococcal group A with C and W135 and Y vaccine at 13-15 years of age</td>
</tr>
<tr>
<td>During adult life, women of child-bearing age susceptible to rubella</td>
<td>▶ Measles, mumps and rubella vaccine, live p. 769 Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation.</td>
</tr>
<tr>
<td>Pregnant females</td>
<td>▶ Acellular pertussis-containing vaccine administered as diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 759 (Boostrix-IPV®) 1 dose from the 16th week of pregnancy, preferably after the foetal anomaly scan (weeks 18-20) ▶ Influenza vaccine p. 767 (Inactivated), Single dose administered from September, regardless of the stage of pregnancy</td>
</tr>
</tbody>
</table>

may be unreliable in babies born earlier than 28 weeks’ gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against Haemophilus influenzae type b, meningococcal C, and hepatitis B after primary immunisation.

Vaccines and HIV infection

HIV-positive children with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; use of normal immunoglobulin should be considered after exposure to measles and varicella–zoster immunoglobulin considered after exposure to chickenpox or herpes zoster), rotavirus;

and the following inactivated vaccines:

- anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis (inactivated poliomyelitis vaccine is now used instead of oral poliomyelitis vaccine for routine immunisation of children), rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive children should not receive:

- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought).

The above advice differs from that for other immunocompromised patients; Immunisation of HIV infected
Children issued by Children’s HIV Association (CHIVA) are available at www.chiva.org.uk.

Vaccines and asplenia
The following vaccines are recommended for asplenic patients, those with splenic dysfunction or complement disorders, depending on the age at which their condition is diagnosed:

- Haemophilus influenzae type b with meningococcal group C vaccine p. 761;
- Influenza vaccine p. 767;
- Meningococcal groups A with C and W135 and Y vaccine p. 762 and meningococcal group B vaccine (rDNA, component, adsorbed) p. 762;
- Pneumococcal polysaccharide vaccine.

Children first diagnosed under 1 year of age should be vaccinated according to the Immunisation Schedule. Additionally, one dose of meningococcal groups A with C and W135 and Y vaccine should be given during infancy followed by a second dose at least one month apart. Two months following the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type B with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually in children aged 6 months or older.

Children first diagnosed between 1 and 2 years of age should be vaccinated according to the Immunisation Schedule, including the 12 month boosters. Two months after the routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine. An additional dose of haemophilus influenzae type B with meningococcal group C vaccine and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually.

Children first diagnosed over 2 years of age should be vaccinated according to the Immunisation schedule, including the 12 month boosters. The child should receive one additional booster dose of haemophilus influenzae type B with meningococcal group C vaccine along with the 23-valent pneumococcal polysaccharide vaccine, followed by one dose of meningococcal groups A with C and W135 and Y vaccine after 2 months. The influenza vaccine should be administered annually.

Passive immunity
Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought (see under Immunoglobulins). The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced whenever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins, but reports of such reactions are very rare.

Vaccines and antiserum availability
Anthrax vaccine and yellow fever vaccine, live p. 771, botulism antitoxin p. 746, diphtheria antitoxin p. 746, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning. Enquiries for vaccines not available commercially can also be made to:

- Vaccines and Countermeasures Response Department
  - Public Health England
  - Wellington House
  - 133–155 Waterloo Road
  - London
  - SE1 8UG
  - vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health.

In Wales enquiries for vaccines not available commercially should be directed to:

- Welsh Medicines Information Centre
  - University Hospital of Wales
  - Cardiff
  - CF14 4XW
  - (029) 2074 2979

In Northern Ireland:

- Pharmacy and Medicines Management Centre
  - Northern Health and Social Care Trust
  - Beech House
  - Antrim Hospital Site
  - Bush Road
  - Antrim
  - BT41 2RL
  - rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

Anthrax vaccine
Anthrax vaccine is rarely required for children.

BCG vaccine
BCG (Bacillus Calmette-Guérin vaccine p. 760) is a live attenuated strain derived from Mycobacterium bovis which stimulates the development of hypersensitivity to M. tuberculosis. Bacillus Calmette-Guérin vaccine should be given intradermally by operators skilled in the technique.

The expected reaction to successful Bacillus Calmette-Guérin vaccine is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

All children of 6 years and over being considered for Bacillus Calmette-Guérin vaccine must first be given a skin test for hypersensitivity to tuberculoprotein (see under Diagnostic agents). A skin test is not necessary for a child under 6 years, provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000 (a list of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.gov.uk/phe), the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years.

Bacillus Calmette-Guérin vaccine is recommended for the following groups of children if BCG immunisation has not previously been carried out and they are negative for tuberculoprotein hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged 16–18 years from Sub-Saharan Africa or a country with an incidence of tuberculosis greater than 500 per 100 000;
- contacts of those with active respiratory tuberculosis;
- children under 16 years intending to live with local people for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000.

Bacillus Calmette-Guérin vaccine can be given simultaneously with another live vaccine, but if they are not given at the same time, an interval of 4 weeks should normally be allowed between them. When Bacillus Calmette-Guérin vaccine is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

For advice on chemoprophylaxis against tuberculosis; for treatment of infection following vaccination, seek expert advice.

**Tuberculosis Diagnostic Agents**

The Mantoux test is recommended for tuberculin skin testing, but no licensed preparation is currently available. Guidance for healthcare professionals is available at [www.dh.gov.uk/immunisation](http://www.dh.gov.uk/immunisation).

In the Mantoux test, the diagnostic dose is administered by intradermal injection of Tuberculin Purified Protein Derivative (PPD).

The Heaf test (involving the use of multiple-puncture apparatus) is no longer available.

Two interferon gamma release assay (IGRA) tests are also available as an aid in the diagnosis of tuberculosis infection: QuantiFERON®-TB Gold and T-SPOT®.TB. Both tests measure T-cell mediated immune response to synthetic antigens. For further information on the use of interferon gamma release assay tests for tuberculosis, see [www.gov.uk/phe](http://www.gov.uk/phe).

**Botulism antitoxin**

A polyvalent botulinum antitoxin p. 746 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by *Clostridium botulinum* types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment, checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

**Cholera vaccine**

Cholera vaccine p. 761 (oral) contains inactivated Inaba (including EI-Tor biotype) and Ogawa strains of *Vibrio cholerae*, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of *V. cholerae*, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential. *Injectable cholera vaccine* provides unreliable protection and is no longer available in the UK.

**Diphtheria vaccine**

Diphtheria vaccines are prepared from the toxin of *Corynebacterium diphtheriae* and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as ‘high dose’ or ‘low dose’. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule). In unimmunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], *tetanus and poliomyelitis (inactivated) vaccine*.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, *tetanus, pertussis (acellular, component) and poliomyelitis* (inactivated) vaccine or adsorbed diphtheria [low dose], *tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine*. Individuals aged over 10 years should receive adsorbed diphtheria [low dose], *tetanus, and poliomyelitis (inactivated) vaccine*.

A second booster dose, of adsorbed diphtheria [low dose], *tetanus and poliomyelitis* (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed). For children who have been vaccinated following a tetanus-prone wound, see tetanus vaccines.

**Travel**

Those intending to travel to areas with a risk of diphtheria infection should be fully immunised according to the UK schedule. If more than 10 years have lapsed since completion of the UK schedule, a dose of *adsorbed diphtheria* [low dose], *tetanus and poliomyelitis (inactivated) vaccine* should be administered.

**Contacts**

Advice on the management of cases of diphtheria, carriers, contacts and outbreaks must be sought from health protection units. The immunisation history of infected children and their contacts should be determined; those who have been incompletely immunised should complete their immunisation and fully immunised individuals should receive a reinforcing dose. Also see advice on antibacterial treatment to prevent a secondary case of diphtheria in a non-immune child.

**Haemophilus influenzae type b conjugate vaccine**

*Haemophilus influenzae* type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. *Haemophilus influenzae* type b vaccine immunisation is given in combination with diphtheria, *tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine*, as a component of the primary course of childhood immunisation (see
Immunisation schedule) (see under Diphtheria-containing Vaccines). For infants under 1 year, the course consists of 3 doses of a vaccine containing *Haemophilus influenzae* type b component with an interval of 1 month between doses. A booster dose of *Haemophilus influenzae* type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae* type b need to receive only 1 dose of *Haemophilus influenzae* type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria with *Haemophilus influenzae* type b vaccine, pertussis, poliomyelitis and tetanus p. 759. The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

*Haemophilus influenzae* type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

**Invasive Haemophilus influenzae type b disease**

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of *haemophilus influenzae* type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or if it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of *haemophilus influenzae* type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

Also see use of rifampicin p. 349 in the prevention of secondary cases of *Haemophilus influenzae* type b disease.

**Hepatitis A vaccine**

Hepatitis A vaccine p. 764 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:

- residents of homes for those with severe learning difficulties;
- children with haemophilia or other conditions treated with plasma-derived clotting factors;
- children with severe liver disease;
- children travelling to high-risk areas;
- adolescents who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- children with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose of hepatitis A vaccine is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

In children under 16 years, a single dose of the combined vaccine Ambirix® can be used to provide rapid protection against hepatitis A. Intramuscular normal immunoglobulin p. 743 is recommended for use in addition to hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

**Hepatitis B vaccine**

Hepatitis B vaccine p. 765 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed on to aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, high-risk groups include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to ‘progress’ to injecting;
- adolescents who are at risk from their sexual behaviour;
- close family contacts of an individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and hepatitis B immunoglobulin given at the same time (but at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother’s e-antigen antibody status);
- children with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- children with chronic renal failure including those on haemodialysis. Children receiving haemodialysis should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- children with chronic liver disease;
- patients of day-care or residential accommodation for those with severe learning difficulties;
- children in custodial institutions;
- children travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances; an ‘accelerated schedule’ is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis. Generally, three or four doses are required for primary immunisation. Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult *Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses* (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.
Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the initial dose, is recommended. For those at continued risk, a fourth dose should be given 12 months after the first dose. More detailed guidance is given in the Immunisation against Infectious Disease handbook.

Specific hepatitis B immunoglobulin (‘HBIG’) p. 743 is available for use with the vaccine in those accidentally in inoculated and in neonates at special risk of infection.

A combined hepatitis A and B vaccine p. 764 is also available.

Human papillomavirus vaccine

Human papillomavirus vaccine is available as a bivalent vaccine (Cervarix®) or a quadrivalent vaccine (Gardasil®). Since 2012, only Gardasil® is offered as part of the national immunisation programme. Cervarix® is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. Gardasil® is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6-24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see later vaccination schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

Females aged 15 years or older require a 3-dose schedule (see Cervarix® and Gardasil®), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. If a 3-dose course of vaccination had been started before September 2014 in a female aged under 15 years, then where possible this should be completed; the interrupted course should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

Under the national programme in England, females remain eligible to receive the vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

Influenza vaccine

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 767 in use contain the H and N components of the prevalent strain or strains recommended each year by the World Health Organization.

The inactivated influenza vaccine is recommended for children aged 6 months–2 years in an at risk group (see below), those aged 18 years and over, in pregnancy and in children with a contra-indication to the live influenza vaccine.

Unless contra-indicated, the live influenza vaccine, administered as a nasal spray (Fluenz Tetra®), is preferred in children aged 2–17 years because it provides a higher level of protection than the inactivated influenza vaccine.

Immunisation is recommended for persons at high risk, and to reduce transmission of infection. Annual immunisation is strongly recommended for children (including infants that were preterm or low birth-weight) aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease at stage 3, 4 or 5;
- chronic neurological disease;
- complement disorders;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: child under 20 kg, 1 mg/kg or more daily; child over 20 kg, 20 mg or more daily] and chemotherapy);
- HIV infection (regardless of immune status);
- morbid obesity.

Seasonal influenza vaccine is also recommended for all pregnant women, for children living in long-stay facilities, and for carers of children whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

In the 2017/2018 national influenza immunisation programme, seasonal influenza vaccine will also be offered to all children who were aged 2–8 years on 31 August 2017 (including those in school years 1, 2, 3 and 4), and all primary school-aged children in former primary school pilot areas.

Further information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/pandemic-flu and at www.gov.uk/phe.

Japanese encephalitis vaccine

Japanese encephalitis vaccine p. 768 is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathnaac.org).

Management of Measles, Mumps and Rubella

Measles vaccine has been replaced by a combined measles, mumps and rubella vaccine, live (MMR vaccine) p. 769.

A combined measles, mumps and rubella vaccine, live (MMR vaccine) aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contra-indication. Measles, mumps and rubella
vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination. The first dose of measles, mumps and rubella vaccine, live is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella vaccine, live p. 769 are required, the second dose should be given one month after the initial dose.

Measles, mumps and rubella vaccine, live may also be offered to previously unimmunised and seronegative post-partum women (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

**Contacts**

Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

**Meningococcal vaccine**

Almost all childhood meningococcal disease in the UK is caused by Neisseria meningitidis serogroups B and C. **Meningococcal group C conjugate vaccine** protects only against infection by serogroup C and **meningococcal group B vaccine** protects only against infection by serogroup B. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the meningococcal groups A, C, W135, and Y conjugate vaccine is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK].

A meningococcal group B vaccine (rDNA, component, adsorbed) p. 762, Bexsero®, is licensed in the UK against infection caused by Neisseria meningitidis serogroup B and is recommended in the Immunisation Schedule. Bexsero® contains 3 recombinant Neisseria meningitidis serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against Neisseria meningitidis serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

**Childhood immunisation**

**Meningococcal group C conjugate vaccine** provides long-term protection against infection by serogroup C of Neisseria meningitidis. Immunisation consists of 1 dose given at 12 months of age (as the haemophilus influenzae type B with meningococcal group C vaccine p. 761) and a second dose given at 13–15 years of age (as the meningococcal groups A with C and W135 and Y vaccine p. 762) (see Immunisation Schedule).

**Meningococcal group B vaccine** provides protection against infection by serogroup B of Neisseria meningitidis. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see Immunisation Schedule above).

Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B vaccine (rDNA, component, adsorbed) followed by a second dose two months later. They should then be vaccinated according to the Immunisation Schedule (ensuring at least a two month interval between doses of meningococcal group B vaccines).

Unimmunised children aged 12–23 months should be given 2 doses of meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months if they have received more than 2 doses in the first year of life. Unimmunised children aged 2–9 years should be given a single dose of meningococcal group C vaccine (as the haemophilus influenzae type B with meningococcal group C vaccine), followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine at 13–15 years of age.

From 2015, unimmunised individuals aged 10–25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine; a booster dose is not required.

Children with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.
Travel
Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnac.org).

Proof of vaccination with the tetravalent (meningococcal groups A, C, W135, and Y) vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts
For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidelines for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

Pertussis vaccine
Pertussis vaccine is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of Bordetella pertussis. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed.

Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

Vaccination of pregnant women against pertussis
In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis–specific antibodies that are transferred, through the placenta, from the mother to the fetus, so that the newborn is protected before routine immunisation begins at 2 months of age.

Pregnant women should be offered a single dose of acellular pertussis-containing vaccine (as adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine; Boostrix-IPV®) between 16 and 32 weeks of pregnancy.

Public Health England has advised (2016) that the vaccine is probably best offered on or after the foetal anomaly scan at around 18–20 weeks. Pregnant women should be offered a single dose of acellular pertussis-containing vaccine up to the onset of labour if they missed the opportunity for vaccination at 16–32 weeks of pregnancy. A single dose of acellular pertussis-containing vaccine may also be offered to new mothers, who have never previously been vaccinated against pertussis, until the child receives the first vaccination.

While this programme is in place, women who become pregnant again should be offered vaccination during each pregnancy to maximise transplacental transfer of antibody.

Contacts
Vaccination against pertussis should be considered for close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

Side-effects
Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:
- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

Pneumococcal vaccine
Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 763 protect against infection with Streptococcus pneumoniae (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci, Pneumococcal polysaccharide vaccine contains purified polysaccharide from 23 capsular types of pneumococci, whereas pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide from either 10 capsular types (Synflorix®) or 13 capsular types (Prevenar 13®) with the polysaccharide being conjugated to protein.

The 13-valent conjugate vaccine is used for childhood immunisation. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule).

Pneumococcal vaccination is recommended for individuals at increased risk of pneumococcal infection as follows:
- child under 5 years with a history of invasive pneumococcal disease;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological conditions;
- complement disorders;
- diabetes mellitus;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: child under 20 kg, 1 mg/kg or more daily; child over 20 kg, 20 mg or more daily);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid could occur.
Where possible, the vaccine should be given at least 2 weeks before splenectomy, coelhlear implant surgery, chemotherapy, or radiotherapy; children and carers should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Prophylactic antibacterial therapy against pneumococcal infection should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Government, Health Protection Division (Tel (0131) 244 2879).

Choice of vaccine
Children under 2 years at increased risk of pneumococcal infection (see list above) should receive the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday. Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

Re vaccination
In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, revaccination with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Revaccination is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for revaccination should be discussed with a haematologist, immunologist, or microbiologist.

Poliomyelitis vaccine
Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccines (for injection) and live (oral) poliomyelitis vaccines. Inactivated poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation; it is given by injection and contains inactivated strains of human poliovirus types 1, 2 and 3.

A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised children; no child should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses should be given every 10 years only to individuals at special risk.

Live (oral) poliomyelitis vaccines is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Travel
Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3–dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre, (www.nathnac.org).

Rabies vaccine
Rabies vaccine p. 770 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and postexposure prophylaxis.

Pre-exposure prophylaxis
Immunisation should be offered to children at high risk of exposure to rabies—where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk. Transmission of rabies by humans has not been recorded but it is advised that those caring for children with the disease should be vaccinated.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Immunisation against rabies requires 3 doses of rabies vaccine, with further booster doses for those who remain at frequent risk.

Post-exposure management
Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual’s immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England’s Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9055 3997/(028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a child has been attacked by rabid animals.
Vaccination

Vaccines

14

Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. 020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the post-eradication era should be consulted at www.gov.uk/phe.

Tetanus vaccine

Tetanus vaccine contains a cell-free purified toxin of Clostridium tetani adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine are given with an interval of 1 month between doses.

When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

Wounds

Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

• For clean wounds: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need)

• For tetanus-prone wounds: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure). Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

Tick-borne encephalitis vaccine

Tick-borne encephalitis vaccine, inactivated p. 770 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of fully immunised individuals (or those who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin p. 745 is not necessary in such cases.

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine. The immunisation course can be discontinued if it is proved that the child was not at risk.

Rotavirus vaccine

Rotavirus vaccine p. 770 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine p. 770 must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

Smallpox vaccine

Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. 020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the post-eradication era should be consulted at www.gov.uk/phe.

Tick-borne encephalitis vaccine

Tick-borne encephalitis vaccine, inactivated p. 770 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.
Typhoid vaccine
Typhoid vaccine p. 763 is available as Vi capsular polysaccharide (from *Salmonella typhi*) vaccine for injection and as live attenuated *Salmonella typhi* vaccine for oral use. Typhoid immunisation is advised for children travelling to:
- areas where typhoid is endemic, especially if staying with or visiting local people;
- endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely;
- Typhoid vaccination is not a substitute for scrupulous personal hygiene.
Capsular polysaccharide typhoid vaccine is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.
Oral typhoid vaccine is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses provides protection 7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to *Salmonella typhi*, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

Varicella-zoster vaccine
Varicella-zoster vaccine (live) p. 771 is licensed for immunisation against varicella (chickenpox) in seronegative individuals. It is not recommended for routine use in children but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections.
Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:
- varicella-susceptible pregnant females;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.
Varicella-zoster immunoglobulin p. 746 is used to protect susceptible children at increased risk of varicella infection.

Yellow fever vaccine
Live yellow fever vaccine, live p. 771 is indicated for those travelling to or living in areas where infection is endemic. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is usually accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.
Very rarely vaccine-associated adverse effects have been reported, such as viscerotrophic disease (yellow fever vaccine, live-associated viscerotropic disease, YEL–AVD), a syndrome which may include metabolic acidosis, muscle and liver cytolysis, and multi-organ failure. Neurological disorders (yellow fever vaccine, live-associated neurotropic disease, YEL–AND) such as encephalitis have also been reported. These very rare adverse effects have usually occurred after the first dose of yellow fever vaccine, live in those with no previous immunity.

Vaccines for travel

Immunisation
See advice on Malaria, treatment p. 371.
No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.
Travellers to areas that have a high incidence of *poliomyelitis* or *tuberculosis* should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available from www.gov.uk/phe); it should preferably be given 3 months or more before departure.
Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, *Health Information for Overseas Travel*, www.dh.gov.uk).
Immunisation against *meningococcal meningitis* is recommended for a number of areas of the world.
Protection against *hepatitis A* is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised. Special care must also be taken with food hygiene.
*Hepatitis B* vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.
Prophylactic immunisation against *rabies* is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.
Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.
Typhoid vaccine is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.
There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where
cholera is endemic should take special care with food hygiene.
  Advice on diphtheria, on Japanese encephalitis, and on tick-borne encephalitis is included in Health Information for Overseas Travel.

Food hygiene
In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

Information on health advice for travellers
Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from: www.nathnac.org.

The handbook, Health Information for Overseas Travel (2010), which draws together essential information for healthcare professionals regarding health advice for travellers, can also be obtained from this website.

Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

Vaccines

Vaccines

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE (APRIL 2016)
Following reports of death in neonates who received a live attenuated vaccine after exposure to a tumor necrosis factor alpha (TNF-a) inhibitor in utero, the MHRA has issued the following advice:
• any infant who has been exposed to immunosuppressive treatment from the mother either in utero during pregnancy or via breastfeeding should have any live attenuated vaccination deferred for as long as a postnatal influence on the immune status of the infant remains possible;
• in the case of infants who have been exposed to TNF-a inhibitors and other biological medicines in utero, any live attenuated vaccination should be deferred until the infant is age 6 months, after which time vaccination should be considered.

CONTRA-INDICATIONS
CONTRA-INDICATIONS, FURTHER INFORMATION
• Impaired immune response Severely immunosuppressed patients should not be given live vaccines (including those with severe primary immunodeficiency).

CAUTIONS
CAUTIONS, FURTHER INFORMATION
• Acute illness · minor illnesses
  Vaccination may be postponed if the individual is suffering from an acute illness; however, it is not necessary to postpone immunisation in patients with minor illnesses without fever or systemic upset.
• Impaired immune response and drugs affecting immune response Immune response to vaccines may be reduced in immunosuppressed patients and there is also a risk of generalised infection with live vaccines.

Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: adults, at least 40 mg daily for more than 1 week; children, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).

  • Predisposition to neurological problems When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is recommended; advice on the management of fever (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is recommended.
  • Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.
  • When there is a still evolving neurological problem, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist.
  • Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
• Common or very common Fatigue · fever · gastro-intestinal disturbances · headache · irritability · loss of appetite · lymphangitis · malaise · myalgia
Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus

**INDICATIONS AND DOSE**

**Primary immunisation**  
**BY INTRAMUSCULAR INJECTION**  
Child 2 months–10 years: 0.5 mL every month for 3 doses

**UNLICENSED USE**  
Infanrix-IPV + Hib® not licensed for use in children over 36 months; Pediacel® not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

**SIDE-EFFECTS**  
Atopic dermatitis • hypotonia • restlessness • sleep disturbances • unusual crying in infants

**SIDE-EFFECTS, FURTHER INFORMATION**  
Side effects of vaccines containing pertussis The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses. The vaccine should not be withheld from children with a history to a preceding dose of:  
- fever, irrespective of severity;  
- persistent crying or screaming for more than 3 hours;  
- severe local reaction, irrespective of extent.

**PRESCRIBING AND DISPENSING INFORMATION**  
Available as part of childhood schedule from health organisations or InnForm.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

- **Powder and suspension for suspension for injection**  
  Infanrix-IPV + Hib (GlaxoSmithKline UK Ltd)  
  Infanrix-IPV + Hib vaccine powder and suspension for suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £72.86
  
- **Suspension for injection**  
  EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin.  
  Pediacel (sanofi pasteur MSD Ltd)  
  Pediacel vaccine suspension for injection 0.5mL vials | 1 vial £32.00

Diphtheria with pertussis, poliomyelitis vaccine and tetanus

**INDICATIONS AND DOSE**

**First booster dose**  
**BY INTRAMUSCULAR INJECTION**  
Child 3–9 years: 0.5 mL, to be given 3 years after primary immunisation

continued →
Vaccination of pregnant women against pertussis (using low dose vaccines)

- **SIDE-EFFECTS** Restlessness, sleep disturbances, unusual crying in infants

**SIDE-EFFECTS, FURTHER INFORMATION**
- Side effects of vaccines containing pertussis. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:
- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

**PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days of previous immunisation with a pertussis-containing vaccine. Contra-indicated in pregnant women with a history of transient thrombocytopenia or neurological complications following previous immunisation against diphtheria or tetanus.

**PREScribing AND DISPEnSing INFORMATION**
- Pregnant women should be vaccinated using low dose vaccines (brands may include *Boostrix-IPV*® or *Repevax*®).
- Available as part of childhood immunisation schedule from health organisations or ImmForm.
- Available for vaccination of pregnant women from ImmForm.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**SUSPension FOR injection**
- EXCIPIENTS: May contain Neomycin, polymyxin b, streptomycin
- *Boostrix-IPV* (GlaxoSmithKline UK Ltd)
  - Boostrix-IPV suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection £22.74
- *Infanrix-IPV* (GlaxoSmithKline UK Ltd)
  - Infanrix-IPV suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection £17.56
- *Repevax* (sanofi pasteur MSD Ltd)
  - Repevax vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection £20.00

**BACILLUS CALMETTE-GUÉRIN VACCINE (BCG Vaccine)**

**DRUG ACTION**
- BCG (Bacillus Calmette-Guérin) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of immunity to *M. tuberculosis*.

**INDICATIONS AND DOSE**
- **Immunisation against tuberculosis**
  - **BY INTRADERMAL INJECTION**
  - Neonate: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.
  - Child 1-11 months: 0.05 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.
  - Child 1-17 years: 0.1 mL, to be injected at insertion of deltoid muscle onto humerus (keloid formation more likely with sites higher on arm); tip of shoulder should be avoided.

**CONTRA-INDICATIONS**
- Generalised septic skin conditions; neonate in household contact with known or suspected case of active tuberculosis.

**CAUTIONS**
- A lesion-free site should be used to administer BCG vaccine to patients with eczema.

**SIGNALS**

**CAUSIONS, FURTHER INFORMATION**
- BCG vaccine can be given simultaneously with another live vaccine, but if they are not given at the same time an interval of 4 weeks should normally be allowed. When BCG is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given in the arm used for BCG vaccination for at least 3 months because of the risk of regional lymphadenitis.

**INTERACTIONS**
- Appendix 1: live vaccines

**SIDE-EFFECTS**
- Rare: Disseminated complications - osteitis - osteomyelitis
- Frequency not known: Prolonged ulceration at the injection site - subcutaneous abscess at the injection site

**PRE-TREATMENT SCREENING**
- Apart from children under 6 years, any person being considered for BCG immunisation must first be given a skin test for hypersensitivity to tuberculoprotein (see tuberculin purified protein derivative p. 747). A skin test is not necessary for a child under 6 years provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000, the child has not had contact with a person with
tuberculosis, and there is no family history of tuberculosis within the last 5 years.

**DIRECTIONS FOR ADMINISTRATION**

Intradermal injection technique. Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb = 0.1 mL injection, 3 mm bleb = 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

**PRESCRIBING AND DISPENSING INFORMATION** Available from health organisations or direct from ImmForm www.immform.dh.gov.uk (SSI brand, multidose vial with diluent).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

- Bacillus calmette-guérin vaccine (Non-proprietary)

Bacillus Calmette-Guerin vaccine powder and solvent for suspension for injection vials | 10 vial | £0 no price available

### Cholera vaccine

**INDICATIONS AND DOSE**

Immunisation against cholera (for travellers to endemic or epidemic areas on the basis of current recommendations)

- **BY MOUTH**
  - Child 2-5 years: 1 dose every 1–6 weeks for 3 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure
  - Child 6-17 years: 1 dose every 1–6 weeks for 2 doses, if more than 6 weeks have elapsed between doses, the primary course should be restarted, immunisation should be completed at least one week before potential exposure

**Booster**

- **BY MOUTH**
  - Child 2-5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated
  - Child 6-17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated

**CONTRA-INDICATIONS** Acute gastro-intestinal illness

**INTERACTIONS** → Appendix 1: cholera vaccine

**SIDE-EFFECTS**

- Rare Cough - respiratory symptoms - rhinitis
- Very rare Insomnia - sore throat
- Frequency not known Abdominal pain and cramps - diarrhoea - nausea - vomiting

**DIRECTIONS FOR ADMINISTRATION** Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2–5 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

**PATIENT AND CARER ADVICE** Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- Dukoral (Valneva UK Ltd)

Dukoral cholera vaccine oral suspension | 2 dose | £32.42

### Haemophilus influenzae type B with meningococcal group C vaccine

**INDICATIONS AND DOSE**

**Booster dose (for infants who have received primary immunisation with a vaccine containing Haemophilus influenzae type b component) and primary immunisation against Neisseria meningitidis**

- **BY INTRAMUSCULAR INJECTION**
  - Child 12-13 months: 0.5 mL for 1 dose

Immunisation against Neisseria meningitidis in an unimmunised patient

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-9 years: 0.5 mL for 1 dose

**Booster dose after recovery from Haemophilus influenzae type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-9 years: 0.5 mL for 1 dose

**Booster dose after recovery from Haemophilus influenzae type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-9 years: 0.5 mL for 1 dose

**Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 2-7 years: 0.5 mL for 1 dose, this booster dose should be given after the second birthday, this is the second dose of haemophilus influenzae type B vaccine combined with meningococcal group C conjugate vaccine (the first dose is given during the routine immunisation schedule)

**Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 2-7 years: 0.5 mL for 1 dose, this booster dose should be followed 2 months later by one dose of meningococcal A, C, W135, and Y conjugate vaccine (in patients from 11 years of age, this interval can be reduced to one month)

**UNLICENSED USE** Not licensed for use in patients over 2 years.

**SIDE-EFFECTS**

- Rare Symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- Frequency not known Atopic dermatitis - hypotonia
Meningococcal group B vaccine (rDNA, component, adsorbed)

**INDICATIONS AND DOSE**

**Immunisation against Neisseria meningitidis, primary immunisation**
- **BY DEEP INTRAMUSCULAR INJECTION**
